2200S Reference Manual

© Wang Laboratories, Inc., 1975
HOW TO USE THIS MANUAL

This manual has been written for the sole purpose of providing quick and concise answers to questions concerning the operation of the System 2200S. It is designed for users who are already quite familiar with the System 2200S and its BASIC language instruction set.

The manual is divided into ten sections covering all the operational features of the System 2200S. The BASIC non-programmable commands in Section VI and the BASIC statements in Section VII are arranged in alphabetical order for ease of locating a desired command or statement.
INTRODUCTION

This manual provides the user with a quick and easy reference guide to questions concerning the operation of the System 2200S. The layout is designed to assist the user in the location of key information.

The manual is divided into ten sections, separated by tabs, for ease of section location. The title page for each section has a listing of the contents of the section. Also, a complete Table of Contents is located in the front of the book.

Section I Introduces you to the Model 2220 Integrated CRT/Single Tape Cassette Driver/Keyboard, the Model 2216 CRT Executive Display; the System 2200S Central Processing Unit (CPU); the three keyboards, Model 2220 Integrated Alphanumeric BASIC Keyboard, Model 2215 BASIC Keyword Keyboard and Model 2222 Alphanumeric Typewriter Keyboard. Unpacking, installation and turn-on procedures also are illustrated.

Section II The basic structure and components of the system are covered in this section, such as: line numbers, spacing, colons, Immediate Mode vs. Programming Mode, and the edit and debug features.

Section III This section describes the elements of a numeric expression including Numeric Variables, Arithmetic Symbols, Numeric Constants, Math Functions, Common Variables, Random Numbers, User Functions and Rational Functions.

Section IV Alphanumeric capabilities are covered in this section, such as: Alpha Strings, Variables, Literal Strings, Alpha Functions, Hexadecimal Literal Strings, Length and String Functions.

Section V I/O Device Selection procedures are illustrated in this section; such things as Device Address for peripherals, Default Address, and Input/Output.

Section VI This section describes, in alphabetical order, the non-programmable commands necessary to communicate with the system.

Section VII All the General BASIC statements needed to effectively utilize the system are covered here, arranged in alphabetical order.

Section VIII This section describes the use of tape cassettes, along with file operation techniques.

Section IX This section illustrates the various errors that can occur in both machine and programming techniques, and includes one of many ways in which an error can be corrected.

Section X This last section, titled Appendices is divided into four subsections: Appendix A, Specifications; Appendix B, Peripherals; Appendix C, ASCII Codes and what the various codes generate; and Appendix D, a list of the various error messages by title and code.

Section 1  General System Introduction

UNPACKING AND INSPECTION

Carefully unpack your equipment and inspect all units for shipping damage. If damage is noticed, do not proceed. Notify the shipping agency. Check equipment received against the purchase order. Decals specifying model numbers can be found on all Wang equipment, usually on the back of each unit.

After unpacking and verifying the status of your equipment, the following procedures are used to install and turn on your 2200S System.

The basic component of the System 2200S is the Central Processing Unit (CPU). All other additional pieces of equipment are considered peripherals and are attached to the CPU. The CPU is divided into two parts; the CPU which consists of the processor, memory and peripheral connectors and a power supply unit which contains the power supply. The ‘Power On’ switch is located on the back panel of the CPU.

INSTALLATION

To install your 2200S System, use the following procedure:

1. Plug all peripherals into CPU chassis. Each peripheral connector on the CPU is labeled for the appropriate device. After each cord is plugged in, make sure the lock clips are snapped in.
2. Plug any peripheral power cords into wall outlets.
3. Plug the power cord of the CPU chassis into a wall outlet.

A maximum of 3 peripherals can be attached directly to the standard CPU in this manner.

TURN-ON PROCEDURE

Use the following procedure to turn ON your 2200S System:

1. Turn power switches ON on all peripherals.
2. Move the main power switch on Central Processor Unit to the ON position. This process Master Initializes the system.
3. The CRT display appears as illustrated below.

Your 2200S system is now ready to use.

If a system failure should occur, try to restore operation by touching the RESET button on the keyboard. If normal operation is not restored Master Initialize the system by turning the power OFF, then ON (power ON/OFF switch on Central Processor). If the system is still non-functional, repeat the installation procedure before calling your Wang Service Representative.
Section I General System Introduction

The Model 2220 Integrated CRT/Tape Cassette Drive/Keyboard

The Model 2220 console provides a Cathode Ray Tube (CRT) for displaying instantly current programs and data, a Single Tape Cassette Drive for saving and loading current programs and text into the 2200S, and an Upper/Lowercase Basic Keyboard for entering data and programs.

The Model 2220 Integrated CRT display is designed to enable the user to write, review, modify and correct programs. The CRT is composed of a 9 inch diagonal screen and four controls used to set the horizontal, vertical, brightness and contrast of the output as it appears on the CRT screen. The screen itself has a maximum of 16 lines, each 64 characters in length. Lines are displayed sequentially on the screen, each terminated by a return, execute character. If more than 16 lines are given at any one time, each new line is added to the bottom of the CRT, moving the previously entered line up; the line at the top of the CRT display is replaced by the line directly beneath it.

The Model 2220 Integrated Single Tape Cassette Drive provides a fast, convenient and low-cost system of storing data and programs. Tape operations discussed in Section VIII also apply to the Model 2220 Integrated Tape Cassette.

The Model 2220 Integrated Keyboard has two modes of operation, Keyword/A and A/a. The mode is selected by the toggle switch in the upper left-hand corner of the keyboard. In Keyword/A mode, unshifted alpha keys (A-Z) produce uppercase letters; shifted alpha keys produce BASIC words. This mode is used primarily for program entry. A/a mode functions as a standard typewriter; unshifted alpha keys produce lowercase letters, shifted alpha keys produce uppercase letters. A/a mode is used for data entry when lowercase is required.
The keyboard is divided into five zones.

**ZONE 1**

The first zone contains the alphabetic and special character keys, most BASIC words and the statement number generator key.

- **STMT NUMBER** automatically sets the statement number of the next line about to be entered equal to the highest line number of the user program in the system + 10.

**ZONE 2**

The second zone consists of numeric entry, arithmetic operator keys and the RETURN (EXEC) key.

- **RETURN (EXEC)** causes the line just keyed in to be entered and processed by the system.

**ZONE 3**

The third zone contains the following program control keys.

- **RESET** immediately stops program execution or listing, clears CRT display and returns control to the keyboard. (Halt/step should be used to stop a program if it is to be restarted by CONTINUE).

- **HALT STEP** causes program to halt at the completion of the current program line or execute one line at a time, each time the key is touched.

- **CONTINUE** continues program execution after a "STOP" verb has been executed, or the "HALT/STEP" key has been touched.
Section I General System Introduction

CLEAR reinitializes the user program text and variable areas.

LOAD causes the current or specified program to be transferred from the tape cassette to memory.

RUN initializes execution of user’s program.

ZONE 4 The fourth zone consists of the 16 user defined Special Function Keys for accessing up to 32 subroutines or test entry operations.

ZONE 5 The fifth zone contains the EDIT mode operations.

EDIT used to enter EDIT mode

RECALL used to recall a program line in memory to edited

-- moves the cursor five spaces to the left.

< moves the cursor a single space to the left.

--- moves the cursor five spaces to the right.

-> moves the cursor a single space to the right.

INSERT expands a line for an additional text and data entry by inserting a space character prior to current cursor position.

DELETE deletes the character at the current cursor position.

ERASE erases a line from the current cursor position to the end of the line.

Model 2223 Alphanumeric/Basic Keyword Keyboard

The Model 2223 Alphanumeric Keyword Keyboard provides all the features of the Model 2220 Integrated alphanumeric/Basic Keyboard in a separate unit. For details refer to the description of the Model 2220 Integrated keyboard (P. 3).
2216 CRT DISPLAY

The CRT is composed of an 8 X 10.5 inch screen, and two controls used to set the brightness and contrast of the output as it appears on the screen. The screen itself has a maximum of 16 lines, each 64 characters in length. The CRT display functions similar to a teletype type printer except that 16 lines can be displayed at a time. Lines are displayed sequentially on the screen, each terminated by a carriage return and line feed character. If more than sixteen lines are given at any one time, each new line is added to the bottom of the CRT, moving the previously entered lines up; the line at the top of the CRT display is replaced by the line directly beneath it.

The following CRT commands, available on the Model 2220 Integrated CRT, the Model 2216 CRT and the Model 2216A CRT, are issued by outputting the specified code by a PRINT HEX (code); statement.

<table>
<thead>
<tr>
<th>HEX CODE</th>
<th>COMMAND</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>cursor home</td>
</tr>
<tr>
<td>03</td>
<td>clear screen &amp; cursor home</td>
</tr>
<tr>
<td>07</td>
<td>bell (CRT option)</td>
</tr>
<tr>
<td>08</td>
<td>cursor left (←)</td>
</tr>
<tr>
<td>09</td>
<td>cursor right (→)</td>
</tr>
<tr>
<td>0A</td>
<td>cursor down (↓)</td>
</tr>
<tr>
<td>0C</td>
<td>cursor up (↑)</td>
</tr>
</tbody>
</table>

For example, PRINT HEX(03); clears the CRT screen.

2216A OPERATING INSTRUCTIONS

(20) Key s

How it appears on the CRT

Wang Laboratories

NOTE:
Using the Model 2215 Keyword Keyboard all lowercase letters must be entered by a PRINT hex code.

Certain characters are available only with the Model 2216A CRT Executive Display; and the Model 2220 Integrated CRT, with OP-30, these characters, with their respective HEX codes, are: left brace (7B), right brace (7D), equivalent sign (7E), broken vertical line (7C), solid rectangle (7F), and prime symbol (60). Please refer to Appendix C, p. 150, for a complete list of 2200S characters and hex codes.

Cleaning the CRT Screen

The CRT screen should be cleaned periodically with a mild soap and water using a soft cloth. Do not use an alcohol pad which might cause damage to the black surface surrounding the screen.

WARNING
Do not attempt to remove the cover for any reason due to the danger of high voltage. Call a Wang Service Representative if any maintenance is required.
Section 1  General System Introduction

AUDIO ALARM OPTION

The Model 2216 CRT Executive Display and the Model 2220 Integrated CRT now can be programmed with an alarm signal. The Audio alarm is designated as Option 4 for the Model 2216 CRT Executive Display and as Option 31 for the Model 2220 Integrated CRT/Tape Cassette Drive/Keyboard. This alarm can be activated only under program control using the code HEX(07) (ASCII Bell Code). Receipt of this code by the CRT causes a 960 Hz beep for a fraction of a second. The display is not affected. A sequence of codes can be transmitted to produce a longer signal or a series of beeps.

There are a variety of uses for this option in the System 2200S. Some examples are:

1. The most general use of the Audio Alarm Signal is in data entry applications. An operator, when entering data, often may be reading a data sheet instead of reviewing the CRT screen for error messages. Therefore, if the data is validated under program control, the alarm code can be sent out to gain the operator’s attention when errors occur. This is very applicable with the System 2200S where numeric data can be INPUT into an alphanumeric variable, tested for numerics (with the NUM function), converted to internal numeric form (CONVERT), and then validated for proper range (see example program).

   NOTE:
The audio alarm is not automatically activated for System 2200S generated errors (i.e., ERR 02, etc).

2. In a telecommunication system, the signal can be used to notify an operator of an incoming message or completion of transmission by transmitting the signal code over the lines to the receiver, just prior to or after the message is sent.

3. The alarm can be used to signal the end of a program or a segment of a program. By programming the alarm to go off, an operator does not have to “baby-sit” the equipment waiting for program completion, but can perform other more meaningful jobs.

```
10    PROGRAM
20     :
30     90
40    100 INPUT A$;
50    110 A = NUM(A$)
60   120 IF A <> LEN(A$) THEN 150
70   130 CONVERT A$ TO B
80   140 IF B < 500 THEN 200
90   150 PRINT HEX(07);
100  155 PRINT "INVALID, REENTER"
110  180 GO TO 100
120  200    :
130    :
140  300 END
```

   PROGRAM
   :
   90
   100 INPUT A$
   110 A = NUM(A$)
   120 IF A <> LEN(A$) THEN 150
   130 CONVERT A$ TO B
   140 IF B < 500 THEN 200
   150 PRINT HEX(07);
   155 PRINT "INVALID, REENTER"
   180 GO TO 100
   200    :
   300 END
2215 BASIC KEYWORD KEYBOARD

The 2215 keyboard permits most BASIC language words to be entered by single keystrokes. For example, pressing the key causes the entire word “PRINT” to be entered.

Uppercase characters can be entered into the system by touching one of the two SHIFT keys and then touching the key containing the desired symbol or function. When a SHIFT key is depressed, a SHIFT light illuminates until another key is touched; then it is extinguished. The SHIFT LOCK key (upper left corner) causes the SHIFT to remain activated while any number of upper case keys are entered; the SHIFT can be subsequently deactivated by touching either SHIFT key. Alternatively the SHIFT key can be held down as on a typewriter, if several uppercase characters are to be entered.

The keyboard is divided into 5 zones.

ZONE 1 The first zone contains the alphabetic and special characters, most BASIC language words, and the statement number generator key.

ZONE 2 The second zone consists of the numeric entry keys and the EXECUTE-CR/LF key.

ZONE 3 Zone three contains the arithmetic operators, mathematical functions and punctuation keys.
Section 1 General System Introduction

ZONE 4 Zone four consists of the following special keys, used for entry and system control:

- **RESET**
  
  . . . immediately stops program listing or execution, clears the CRT screen, and returns control to the user, leaving program text and variables intact.

- **HALT/STEP**
  
  . . . causes program to halt or execute one line at a time each time the key is touched.

- **LINE ERASE**
  
  . . . deletes the line currently being entered.

- **← (BACK)**
  
  . . . backspace — deletes the result of the last keystroke entered.

- **→ (SPACE)**
  
  . . . enters a space character.

ZONE 5 Zone five consists of 16 user defined Special Function Keys for access of up to 32 subroutines or text entry operations and the EDIT key for Edit operations (see page 17 of this manual and the Option 3 Reference Manual for a detailed discussion of the EDIT mode).
Section 1 General System Introduction

MODEL 2222 ALPHA-NUMERIC TYPEWRITER KEYBOARD

The 2222 keyboard is designed for users who already are familiar with a standard selectric typewriter, or for those users whose applications require large amounts of alpha input.

The 2222 keyboard is divided into four major zones which are, in some respects, similar to the zones of the 2215; however, the differences lie in the way BASIC words are generated. With the 2222, most BASIC language words must be keyed in one character at a time (similar to a typewriter). This is compared to the keyword section of the 2215 where one keystroke can generate an entire word. Either way, however, takes up the same amount of space in memory.

ZONE 1

Zone 1 of the 2222 keyboard is very similar to a regular selectric typewriter keyboard, which includes all alpha characters, both upper and lowercase, numbers 0-9, and all of the typical special characters.

ALPHA CONTROL SWITCH

An integral part of Zone 1 is the addition of an Alpha Control Switch. The reason for this switch is to more easily write programs in BASIC. This switch acts somewhat similar to a shift key; however, the switch only conditions alpha characters to always be upper case and in no way interferes with the other keys on the keyboards.

DOWN POSITION

In the down position the keyboard acts as a standard typewriter keyboard.
Section 1  General System Introduction

UP POSITION

In the up position, the keyboard conditions the system to generate all uppercase alpha characters regardless of the position of the shift key. This is just for the 26 alpha keys and in no way does this condition change the input capabilities of the other keys on the keyboard. For uppercase keys other than alpha characters, the shift key must be used. This would be the normal position setting when entering BASIC programs, since BASIC statement words and variables require uppercase alphabetic characters.

RETURN (EXEC.)

... causes the line just keyed in to be entered and processed by the system.

BACK SPACE

... deletes the result of the last keystroke entered.

ZONE 2

Zone 2 contains all the numeric entry keys and arithmetic operators, along with a number of math functions. Immediate mode calculations can be generated using the PRINT key followed by a legal calculating expression. This set of 20 keys is generally considered a "scratch pad" calculator for immediate mode calculations; however, these keys can be used to enter program line numbers, numbers and functions.

ZONE 3

Zone 3 consists of the following special keys used for entry and system control.

RESET

... immediately stops program listing or execution, clears the CRT screen, and returns control to the user, leaving program text and variables intact.

HALT/STEP

... causes program to halt or execute one line at a time each time the key is touched.

LINE ERASE

... deletes the line currently being entered.

CONTINUE

... continues program execution after a "STOP" verb has been executed, or the "HALT/STEP" key has been touched.

RUN

... initiates execution of the user's program.
Section I General System Introduction

ZONE 4 Zone 4 consists of 16 user defined special function keys for access of up to 32 subroutines or text entry operations and the EDIT key for Edit operations (see page 17 of this manual and the Option 3 Reference Manual for a detailed discussion of the EDIT mode).

System 2200S Central Processor Unit

The standard System 2200S Central Processor Unit has a user memory (RAM) of 4096 (4K) bytes (eight-bit words). This can be expanded in increments of 4K up to a maximum of 16K, self-contained in the 2200S chassis.

An outstanding feature of the System 2200S is that the BASIC language compiler is hardwired in a separate section of the calculator, allowing nearly* the entire memory to be accessed by the user. Also the EDIT mode, which allows editing of lines of program text recalled from memory or data being input and displayed on the CRT, is a standard feature of the System 2200S.

The CPU contains slots for up to 3 I/O peripheral devices. An additional 3 I/O slots (Option 20) can be ordered with the System 2200S or added to a previously purchased System.

*Approximately 700 bytes are used for "housekeeping" purposes.

Section II  BASIC Language Structure

INTRODUCTION
A BASIC program must have a certain structure - simple though it is. The rules are few and easy to follow. Certain components should be used in the structure of a program. These components include allowable characters, kinds of symbols, and various functions that can be used in BASIC.

LINE NUMBER
Every program line must begin with a line number. It may be 1 to 4 digits in length. Line numbers identify the lines and specify the order in which the program lines are to be executed. These lines do not have to be entered in sequential order; the BASIC system automatically arranges and processes the lines in order according to the line number. Line numbers should be assigned with a suitable increment between consecutive lines for the insertion of additional lines. Line numbers can be entered by pressing the statement number key (2215, 2220 keyboard) which automatically generates a new line number, or by manually keying in the digits in the line number. Line numbers must not be preceded by spaces.

BASIC WORDS
BASIC words (i.e., PRINT, NEXT, SAVE, TO) can either be entered as single keystroke entries by pressing the appropriate key or by typing in each character in the word. In either case, only 1 byte of memory is required to store the word.

BASIC STATEMENT LINES
Each statement line is comprised of a line number and at least one statement. A series of statements, separated by colons, may be entered on the same line - with one line number.

Example:

40  X = 2 : Y = 3 : PRINT X, Y

There are two types of statements:
1. An executable statement specifies the action to be performed.

Example:

Q = 8*Y

2. A nonexecutable statement provides information

Example:

DATA 2, -7, 5

One statement line cannot exceed 192 keystrokes.

SPACING
Spaces are customarily used between characters in a program line for readability; the system ignores them. For example, 10 READ A, B, C, D is easier for the programmer to read than 10READA,B,C,D; both, however, are equally clear to the BASIC system. The condensed format conserves user text area space.

COLON
The colon (:) is displayed by the system to indicate that the programmer may proceed to enter program lines. This symbol is also useful for identifying lines in the program listing - those preceded by a colon were entered by the user; all others were system output.
Section II  BASIC Language Structure

IMMEDIATE MODE
The Wang 2200S BASIC system provides for two modes of operation, PROGRAM and IMMEDIATE.
The IMMEDIATE mode allows the System 2200S to be used as a powerful one-line calculator. The BASIC statements are entered with no preceding line numbers. The absence of a line number causes the system to check the line for grammatical correctness and, if no errors exist, to execute immediately the statements in the line. The line is not saved and requires only temporary storage space.

Multi-Statement Immediate Mode Lines
When using more than one BASIC statement on a line, a colon (:) must be placed between each statement. The ability to place several statements on a single line makes the immediate mode a very powerful calculating tool.

Example:

Key IN              FOR I=1 TO 10: PRINT I, LOG(I) :NEXT I RETURN(EXEC)

Ten values of I and LOG(I) would be printed immediately.

PROGRAM MODE
The PROGRAM mode requires each line to be preceded by a line number of from 1 to 4 digits. The presence of the line number causes the system to check the line for grammatical correctness, store the line and await further instructions from the user. In this way, an entire program can be entered line by line, checked for syntax errors, and then saved, listed, or executed by the user.

<table>
<thead>
<tr>
<th>CR/LF-EXECUTE KEY</th>
<th>RETURN EXEC</th>
<th>OR</th>
<th>EXECUTE CR/LF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>2222, 2220</td>
<td></td>
<td>2215</td>
</tr>
</tbody>
</table>

The CR/LF-EXECUTE key is used in both the immediate mode and the program mode. It must terminate every line of input to the system. When entered, it causes the following:

1. IMMEDIATE MODE  - If the statement line does not have a line number in front of it, the line is checked for BASIC grammatical correctness and, if found to be correct, the line is immediately executed.

2. PROGRAM MODE    - If the statement line has a line number in front of it, the line is checked for BASIC grammatical correctness and entered into the 2200S memory.

3. COMMANDS        - The command is checked for BASIC grammatical correctness and executed.

NOTE:
If a syntax error is found in either mode, the appropriate error code is displayed along with an up arrow symbol pointing out the error. The system then returns control to the user by displaying a colon on the CRT display.

ILLEGAL IMMEDIATE MODE STATEMENTS

| DATA        | INPUT    | RETURN |
| DEFFN       | KEYIN    | RETURN CLEAR |
| GOSUB       | PRINT USING | STOP |
| IF          | READ     | % (IMAGE statement) |
|             | RESTORE  | |
|             | IF-END THEN | |
|             | ON       | |

16
Section II BASIC Language Structure

EDIT MODE

The EDIT mode provides the capability to correct a partially entered line or a line already in memory without having to retype the entire line.

The unique special function EDIT key, at the right hand side of the special function key pad, allows a user to enter EDIT mode at any point during keyboard data or program entry operations (Console Input or INPUT statement). The EDIT mode is indicated on the CRT display by an asterisk displayed to the left of the current input line.

When in EDIT mode, the eight special function keys on the right side of the special function key pad can be used to perform editing operations on a partially entered line or to RECALL and edit a program line already stored in memory. When the corrected line finally is entered into the System 2200S (e.g., RETURN (EXEC) is touched), the system leaves the EDIT mode and the special function keys can be used in a normal manner.

The editing functions available on the eight right most special function keys are indicated on the special function strip below the keys. The operations are indicated below. (For completed details, refer to the Option 3 character Edit ROM Reference Manual).

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECALL</td>
<td>Recalls and displays for editing a specified BASIC statement (statement number is entered prior to depressing RECALL).</td>
</tr>
<tr>
<td>←------</td>
<td>Moves the cursor five characters to the left.</td>
</tr>
<tr>
<td>←------</td>
<td>Moves the cursor one character to the left.</td>
</tr>
<tr>
<td>→------</td>
<td>Moves the cursor one character to the right.</td>
</tr>
<tr>
<td>→------</td>
<td>Moves the cursor five characters to the right.</td>
</tr>
<tr>
<td>INSERT</td>
<td>Insert a space prior to the current cursor position.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Removes character at the current cursor position.</td>
</tr>
<tr>
<td>ERASE</td>
<td>Removes all characters at and beyond the current cursor position.</td>
</tr>
</tbody>
</table>
Section II  BASIC Language Structure

DEBUGGING AND EDITING FEATURES
Debugging a program on any system can often be a difficult and time-consuming job. The special edit and debug features of the Wang 2200S combined with the sixteen line visual CRT display help make this task much easier.

Character Erasing
Single keystroke entries in the current text line can be removed by touching the backspace key

Example:

:120  X=SQR (2+COS(17)

Key

Example:

:120  X=SQR(2

:120  X = SQRT(2 – COS(17))

Removing the Current Line
The line currently being entered can be removed from the screen by touching the LINE ERASE key.

Example:

:300  PRINT "RESULT": A(4 –

Key
Section II  BASIC Language Structure

Deleting a Line
A previously entered text line can be deleted by keying the line number of that line and the CR/LF-EXECUTE key.

Example:

```
READY
:LIST
10A = 14
20 PRINT A
.
.
.
Key 20 CR/LF-EXECUTE
Key LIST CR/LF-EXECUTE
:LIST
10A = 14
:--
```

Replacing a Line
An existing line can be replaced by entering the same line number followed by the new line and CR/LF-EXECUTE.

Renumbering a Program
A program can be renumbered by using the RENUMBER command, so that spaces can be made between closely numbered lines in order to insert additional lines of text.

Example:

```
READY
:100 IF I=4 THEN 102
:101 PRINT X, Y, I
:102 READ A, b$
:RENUMBER 101, 110
:LIST
100 IF I=4 THEN 120
110 PRINT X, Y, I
120 READ A, b$
```

RENUMBER, starting at old line 101, using 110 as a starting statement line number, using an increment of 10
Section II  BASIC Language Structure

Stepping Through a Program
Program execution can be halted at any time by touching the HALT/STEP key. Variables can be examined or modified by immediate execution statements; and execution can be continued by keying CONTINUE RETURN (EXEC). If, after a program has been halted, the user wishes to step through the program, he continues touching the HALT/STEP key. Each time the key is touched, the next statement is executed; the executed statement and any normal printed result of that statement is displayed. Program stepping can be started at a particular statement line by entering a GOTO 'line number' statement, in the immediate mode.

Example:
Enter the following program in memory:

   10 FOR I = 1 TO 10
   20 S = S + 1
   30 PRINT S
   40 NEXT I

OPERATING INSTRUCTIONS:

Key    GOTO 10

Key    HALT/STEP
    :
   10 FOR I = 1 TO 10

Key    HALT/STEP
    :
   20 S = S + 1

Key    HALT/STEP
    :
   30 PRINT S
       1

Key    HALT/STEP
    :
   40 NEXT I
    :

The system can also be placed in TRACE mode and stepped. This provides both a display of each executed statement and the calculated results of each statement.

Executing a Program at any Given Line
Program execution can be started at any desired line by entering a RUN 'line number' command.

Example:

Key    RUN 130 CR/LF-EXECUTE

NOTE:
The user should not begin execution in the middle of a FOR/NEXT loop or subroutine.
Section II  BASIC Language Structure

Programmable Trace

The TRACE statement provides for the tracing of the execution of a BASIC program. TRACE mode is activated in a program when a TRACE statement is executed and deactivated when TRACE OFF statement is executed. When in the TRACE mode, printouts are produced when:

1. Any program variable receives a new value during execution; e.g., in LET, READ, FOR statements.
2. A program transfer is made to another sequence of statements; e.g., in GOTO, GOSUB, IF NEXT statements.

Example:

```
READY
:10  X = 1.2
:20  TRACE
:30  X = 2*X
:40  IF X > 2 THEN 100
:50  STOP
:100 TRACE OFF
:110  Y = X
:120  STOP
:RUN
```

Trace Outputs

```
X = 2.4
TRANSFER TO 100
STOP
```

Pause

The output of a program can be slowed down for easier visual inspection by selecting a pause of from zero to one-and-a-half seconds. A pause is generated whenever a CARRIAGE RETURN is output to the CRT display or a printer. The pause is turned on and off by executing the appropriate SELECT P 'digit' statement; the digit specifies the number of 6th's of a second to pause (i.e., P3 = 3 x 1/6 = 1/2 sec. pause). The pause feature is programmable, and can be turned on and off within a program.

Example:

```
READY
:100  TRACE :SELECT P6
:110  FOR I = 1 TO 20
:120  A(I) = I*COS (32.5)
:130  NEXT I
:132  TRACE OFF :SELECT P0
```

NUMERIC CONSTANTS ...................................... 26
MATHEMATICAL FUNCTIONS ............................... 27
RANDOM NUMBERS ........................................ 28
ADDITIONAL NUMERIC FUNCTIONS ..................... 28
Section III Numeric Expressions

EXPRESSIONS

An expression may be a variable, a function or a constant or any valid combination of variables, functions, and constants connected by arithmetic symbols. An expression may be preceded by plus or minus and may be contained within parentheses. The following examples illustrate BASIC expressions:

\[
X = \begin{cases} 
A \\ 
5 \cdot Y + \text{FB}(X) - \log(Z) \\ 
J(\begin{cases} X2+5 \\ K\end{cases},9) \\ 
\text{FOR} \ I = \begin{cases} 3+K2 \\ 4 \cdot Y \end{cases} \ \text{TO} \ \begin{cases} A \cdot Y \\ D(3+K) \cdot 1 \end{cases} \ \text{STEP} \ \begin{cases} D(3+K) \cdot -1 \\ \text{SIN} \cdot (K) \cdot -4 \cdot J \end{cases} \\
\end{cases}
\]

Operations in an expression are executed in sequence from highest priority level to lowest, as follows:
1. Operations within parentheses
2. Exponentiation (↑)
3. Multiplication or division (× or /)
4. Addition or subtraction (+ or -)

Quantities within parentheses are evaluated before the parenthesized quantity is used in further computations. In the absence of parentheses, exponentiation is performed first, then multiplication and division, and finally addition and subtraction. For example, in the expression \( 1 + A / B \), \( A \) is divided by \( B \) and then 1 is added to the result. When there are no parentheses in the expression and the operations have the same priority level, these operations are performed from left to right. For example, in the expression \( A \cdot B / C \); \( B \) is multiplied by \( A \) and the product is divided by \( C \).

NUMERIC VARIABLES

A variable name is a string of characters that represents a data value. A variable can be given a new value in certain executable statements such as READ, LET, INPUT, NEXT, FOR. The value assigned to the variable in a program statement does not change until a second program statement is encountered which assigns a new value to the variable.

There are two types of numeric variables: scalar and array. A scalar numeric variable is designated by a letter or a letter followed by a digit: there are 286 legal scalar variable names.

Example:

\[ A, A4 \]

Array variables are used to define the elements of an array. These variables are used when a single subscript or a double subscript might ordinarily be used.

\[(a_1, a_2, a_3, \ldots) \text{ or by } b_{ij} \]

A numeric array variable consists of a letter or a letter followed by a digit which is the array name, followed by subscripts in parentheses:

\[ A(3), C3(5), B(2,3), D(N, M-2), E1(5), F3(N,M) \]
Section III Numeric Expressions

For all array variables, the DIM statement is used with the array name and the numeric value subscripts to provide space and specify the dimensions of a complete array of one or two dimensions. The DIM statement must precede the first reference to the variables.

Example:

```
READY
:20 DIM Q(25)    defines the 1-dimensional array Q with 25 elements
:30 READ N
:40 FOR I = 1 to N
:50 READ Q(I)
:55 PRINT Q(I)
:60 NEXT I
:70 DATA 5
:80 DATA 4, 5, 19, 37, 43
etc.
:`
```

For cases where an array variable is used as common data, it is specified in a COM (common) statement instead of a DIM statement to provide storage space.

The following rules apply to the use and assignment of array variables:
1. The numeric value of the subscript for the first array element must be 1; zero is not allowed.
2. The dimension(s) of an array cannot exceed 255.
3. The total number of elements in an array must not exceed 4096.

An array variable and a scalar variable may have the same name; they are independent, unrelated variables. Single subscripted and double subscripted arrays may not be defined with the same name.

COMMON DATA
The sharing of data common to several programs is possible by using the COM statement. Variables with data to be used in subsequent programs are defined to be common in a COM statement.

Example:

```
COM A(2, 4), B, C
```

defines the array A (of dimension 2 by 4) and the scalars B and C to be common data. When a RUN command is issued, all noncommon variables are removed from the system; common variables are not disturbed. In addition, common data can be retained when a new program is loaded or overlayed, and thus are passed onto the next program. Common variables are cleared from memory when a CLEAR or CLEAR V command is executed.
Section III Numeric Expressions

ARITHMETIC SYMBOLS
The following arithmetic symbols are used in BASIC to write a formula. Operations are executed in sequence from the highest level to the lowest level: (1) operations within parentheses, (2) raising a number to a power, (3) multiplication and division, and (4) addition and subtraction.

<table>
<thead>
<tr>
<th>SYMBOL</th>
<th>SAMPLE FORMULA</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>↑</td>
<td>A↑B</td>
<td>Raise A to the power of B.</td>
</tr>
<tr>
<td>*</td>
<td>A*B</td>
<td>Multiply B by A.</td>
</tr>
<tr>
<td>/</td>
<td>A/B</td>
<td>Divide A by B.</td>
</tr>
<tr>
<td>+</td>
<td>A+B</td>
<td>Add B to A.</td>
</tr>
<tr>
<td>-</td>
<td>A-B</td>
<td>Subtract B from A</td>
</tr>
</tbody>
</table>

RELATIONAL SYMBOLS
Relational symbols are used with the IF verb when values are to be compared before processing. For example: 20 IF G < 10 THEN 63 means that if G is less than 10, processing continues at program line 63.

The following relational symbols may be used with BASIC:

<table>
<thead>
<tr>
<th>SYMBOL</th>
<th>SAMPLE RELATION</th>
<th>EXPLANATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>A=B</td>
<td>A is equal to B</td>
</tr>
<tr>
<td>&lt;</td>
<td>A&lt;B</td>
<td>A is less than B</td>
</tr>
<tr>
<td>&lt;=</td>
<td>A&lt;=B</td>
<td>A is less than or equal to B</td>
</tr>
<tr>
<td>&gt;</td>
<td>A&gt;B</td>
<td>A is greater than B</td>
</tr>
<tr>
<td>&gt;=</td>
<td>A&gt;=B</td>
<td>A is greater than or equal to B</td>
</tr>
<tr>
<td>&lt;&gt;</td>
<td>A&lt;&gt;B</td>
<td>A is not equal to B</td>
</tr>
</tbody>
</table>

USER FUNCTIONS
A user function is a mathematical function of a single variable, which is used several times within a program. Such a function is defined by a DEFFN statement. The format of the function is a letter or a digit, a scalar variable in parentheses, an equals sign, and an expression. (i.e., Y(X) = 2 * X ↑ 2 + 3 * X - 7). A function could be used in a program as follows: The function is defined: 30 DEFFN E (Z1) = EXP (-Z1↑3+5). If the following statement is entered, 40 Q = A/B + FNE(10), the value of 10 is assigned to Z1; the result, EXP (-10↑3+5) will be used in place of the referenced FNE(10) in program line 40.
NUMERIC CONSTANTS

A numeric constant may be positive or negative and may consist of as many as 13 digits. Numbers with greater than 13 digits result in an illegal number format error. The following are examples of numeric constants in BASIC:

4, −10, 1432443, −.7865, 24.4563

If the exponential notation, $E$, is used, the value of the constant is equal to the number to the left of the $E$ multiplied by 10 to the power of the number to the right of the $E$. For example, $4.5E7$ indicates that 4.5 to be multiplied by $10^7$.

The magnitude of a numeric constant can be anywhere between $10^{100}$ and $10^{-100}$.

Invalid Use of Scientific Notation

8.7E5.8  Not valid because of the illegal decimal form of the exponent.
−103.2E99 Not valid because in reduced form, it is equivalent to −1.032E101, an exponent greater than E100.
.87E−99  Not valid because it is equivalent to 8.7E−100, which is less than E−100.

*Unless instructed otherwise, the argument is interpreted in radians. Degrees, grads \((360^\circ = 400 \text{ grads})\), or radians can be selected by entering the following statements:

- SELECT D CR/LF–EXECUTE —selects degrees for all following calculations.
- SELECT R CR/LF–EXECUTE —selects radians for all following calculations.
- SELECT G CR/LF–EXECUTE —selects grads for all following calculations.

**The arctangent notation ATN( is also a recognized function notation.
Section III Numeric Expressions

RANDOM NUMBERS

Each time the RND function is used, a random number is produced with a value between 0 and 1. If the argument of the RND function is not zero, the next number in the ‘random number list’ is produced. If the argument is zero, the first random number in the ‘list’ is produced. RND (0) is useful when debugging programs involving random numbers since the same results can be produced each time the program is executed.

The example below prints out the first 100 numbers in the ‘random number list’ each time the program is executed. Deletion of Line 10 produces a different set of random numbers each time the program is executed.

Example:

```
READY
:10  X = RND (0)
:20  FOR I = 1 TO 100
:30  PRINT RND (I)
:40  NEXT I
:。
```

Whenever the system is Master Initialized (Power On), the random number generator is initialized; the next time RND is used, the first random number in the list will be produced.

ADDITIONAL NUMERIC FUNCTIONS

The following additional functions can be used in expressions:

- **NUM**: Test if a string of characters is a legal BASIC number.
- **VAL**: Binary value of a string character.
- **LEN**: Length of a string.

For detailed descriptions see Section IV for LEN, and Section VII for NUM and Val.

33
33
33
ALPHANUMERIC STRING VARIABLES

The Wang 2200S provides for an additional form of variable, the alphanumerical string variable. It is distinguished from numeric variables by the manner in which it is named, a letter or a letter and a digit followed by a $. String variables permit the user to process alphanumerical strings of characters (such as names, addresses and report titles).

Both alphanumerical scalar variables and alphanumerical array variables may be used. The dimensions of string arrays must be specified in a DIM or COM statement prior to their use in the program.

Formats for alphanumerical string variable names are given below; items enclosed in brackets are optional.

- Alphanumeric scalar string variable
  - 'letter' ['digit'] $ i.e., A$, B$, C1$

- One-dimensional alphanumerical string array variable
  - 'letter' ['digit'] $(d_1)$ i.e., A$ (3)$, B$ (3)$

- Two-dimensional alphanumerical string array variable
  - 'letter' ['digit'] $(d_1, d_2)$ i.e., A$ (2, 3)$, B$ (4, 8)$
  - where $d_1$ and $d_2$ are expressions whose values are $\geq 1$ and less than 256.

Each string variable or string array element is initially assigned a value of 1 blank character. Thereafter, it can take the value and length of any alphanumerical character string up to its maximum length. The maximum length of a string variable is assumed to be 16 characters; however, the user may change the maximum length (up to 64) by using a DIM or COM statement. If a string variable receives a string value of less than its maximum length, it reflects that shorter length in all subsequent operations until it receives another value. The end of the alphanumerical value is assumed to be the last nonblank character (except when the value is all blanks, in which case the value is assumed to be one blank).

*Example:*

```
READY
:10  A$ = "ABC"
:20  PRINT A$
:--
```

Execution of these statements would print "ABC" with no trailing spaces.

Hence, trailing blanks are not considered part of alphanumerical values.
Section IV Alphanumeric

ALPHANUMERIC LITERAL STRINGS

An alphanumeric literal string is a character string enclosed in double quotation marks. It is used in conjunction with string variables to provide a string value within a BASIC statement.

Example:

```
READY
:10  LET A$ = "ABCD"
:20  IF B$ < "#XYZ" THEN 100
:30  PRINT "NAME" ; A$
:--
```

When inputting data, the literal string need not be enclosed in quotes. In this case, commas and carriage returns act as string terminators and leading spaces are ignored; hence if commas or leading spaces are to be included in the literal string, the string must be enclosed in quotes.

Literal strings may be any length that can be expressed on one program line. However, when they are used to store values in string variables, they are truncated to the maximum length defined for the string variable value.

Example:

```
LET A$ = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
```

In this statement, A$ only receives the first 18 characters of the literal string (i.e., ABCDEFGHIJKLMNOPQRST) if the maximum length of A$ is 18; otherwise it is set to 16 (see DIM; page 66).

EXAMPLES OF STATEMENTS USING STRING VARIABLES

Alphanumeric string variables can be used in the BASIC statements listed below. Literal strings can generally be used in place of string variables, except where a value is assigned to the string variable.

```
LET A$ = B$(2)
   A$ = "ABCD"
IF A$ = B$ THEN 100
   IF A$ < "DR" THEN 200
   IF "ABCD" > B$ THEN 300
INPUT A$, B$(4)
READ C$, D$, E$(1,2)
DATALOAD #2, A$, B$
PRINT A$, B$, "ABCD"
PRINT USING 50, A$, B$, "LAST"
DATASAVE DATASAVE A$, "GROUP1"
DATA DATA "ABCD", "EFGH"
```

NOTE:

When comparing string variables with string literals or other string variables (i.e., IF A$ < "ABCD"), trailing spaces are ignored and only the values of the strings are compared.
Section IV Alphanumerics

STR (STRING) FUNCTION

Wang 2200S BASIC provides a function which permits the user to extract, examine, compare or replace a specified portion of an alphanumeric string. The STR function operates on alphanumeric string variables, and can be used in any BASIC statement where alphanumeric variables are permissible. It has the following format; items enclosed in brackets are optional.

\[
\text{STR} \left( \text{string variable, } X_1 \left[ , X_2 \right] \right)
\]

where \( X_1 \) = Starting character in sub-string (an expression).
\( X_2 \) = Number of consecutive characters desired (an expression; the specification of \( X_2 \) is optional).

Example:

\[
\text{STR}(A\$,3,4)
\]

This statement means take the 3rd, 4th, 5th, and 6th characters of \( A\$. \)

\[
\text{STR}(A\$,3)
\]

This statement means, starting with the 3rd character, take the remainder of the string \( A\$. \)

In BASIC statements, STR functions can be used wherever string variables are used. They may be used on either side of an equal sign or relation. The following examples illustrate use of the string function:

Assuming \( B\$="ABCDEFGH" \)

10 A\$=STR(B\$,2,4) \hspace{1cm} \text{---A\$ is set to "BCDE".}

20 STR(A\$,4) = B\$ \hspace{1cm} \text{---Characters 4 through 11 of A\$ are set to "ABCDEFGH".}

30 STR(A\$,3,3)=STR(B\$,5,3) \hspace{1cm} \text{---The 3rd, 4th and 5th characters of A\$ are set to "EFG".}

40 IF STR(B\$,3,2)="AB" THEN 100 \hspace{1cm} \text{---Characters "CD" of B\$ are compared to the literal string "AB".}

50 READ STR(A\$,9,9) \hspace{1cm} \text{---Characters 9 through 17 of A\$ receive the next data value read.}

When the STRl function is used as a receiver in a LET statement and the value to be received is shorter than the receiver, the receiver is padded with trailing spaces, for example.

\begin{align*}
:10 & \ A\$ = "12345" \\
:20 & \ \text{STR}(A\$, 2, 3) = "A" \\
:30 & \ \text{PRINT} \ "A\$ = " ; A\$ \\
& \text{RUN} \\
A\$ & = 1A \ 5
\end{align*}
Section IV Alphanumeric

LEN (LENGTH) FUNCTION
Wang 2200S BASIC provides a function, LEN(), which permits the user to determine the number of characters in a given string variable. The LEN function can be used whenever a math function is permitted.
The format of the length function is:
LEN(string variable)

Example:
A$ = "ABCD"
LEN(A$) has a value of 4

NOTE:
Trailing blanks are not considered to be part of the value of a string variable.

Examples:
100 X = LEN(A$) + 2
110 IF LEN A$(3) > 8 THEN 150

HEX (HEXADECIMAL) FUNCTION
The HEX function is a form of literal string that enables a user to use any 8-bit codes in a BASIC program; it may be used wherever literal strings enclosed in double quotes may be used. The HEX function has the following format; items in brackets are optional.

HEX (hexdigit hexdigit [ { hexdigit hexdigit } . . . ])
where hexdigit = a digit 0 - 9 or a letter A - F.

Example:
Executing the following statement clears the CRT display.
:PRINT HEX (03)

Executing the following statement sets the string variable, A$, equal to the 3 characters: \(81_{16}\), \(82_{16}\), and \(34_{16}\).

A$ = HEX (818234).

Any character can be represented by two hexadecimal digits. A complete list of HEX codes pertaining to the CRT is given in Appendix C.

LOWERCASE LITERALS
A special form of literal string is available for specifying lowercase characters; the literal string is enclosed in single quotes. For example, the following statement

:PRINT "J";'OHN'; " D";'OE'
outputs 'John Doe' on peripheral devices capable of printing lowercase letters.

The following characters are valid for use in lowercase literals.

Letters: ABCDEFGHIJKLMNOPQRSTUVWXYZ
Digits: 0123456789
Special Characters: blank ! " # $ % & ( ) * + , - . / : ; < = > ?
Section V

I/O Device Selection

INTRODUCTION
SYSTEM 2200S DEVICE SELECTION

Each peripheral I/O device associated with the System 2200S is assigned a unique device address. All device addresses are composed of three-digit hexadecimal numbers. The first hex digit identifies the device type. It is used by the system when controlling the I/O operation. The last two hex digits represent the actual device address, which is used to electronically select the device for operation.

The device type digit is used by the System 2200S to identify what type device is being selected for an I/O operation. The various peripheral devices on the System 2200S often require different control procedures to perform an input/output operation. For example, a type digit of 1 signifies cassettes, a type digit 2 indicates output prints. The last two digits correspond to the actual device address which is preset in each device controller card in the System 2200S CPU. For example, if a System 2200S has two cassette drives two unique addresses are available for cassettes.

When a System 2200S BASIC command or statement which performs in input/output operation is executed, the appropriate device can be selected in one of three ways.

1. DEFAULT (Primary Console Device) - If not device address is specified or selected, the System 2200S automatically provides the device address which is most commonly used for that particular operation.
2. SELECT - The System 2200S SELECT statement can be executed. It assigns device addresses for specified I/O operations.
3. SPECIFICATIONS - The device address can be supplied with the BASIC I/O statement or command, either absolutely or indirectly.

SELECT ........................................... 35
DEVICE ADDRESSES FOR SYSTEM 2200S PERIPHERALS ........... 36
DEFAULT DEVICE ADDRESS SELECTION ......................... 37
THE INPUT AND PRINT PARAMETERS ........................ 39
THE LIST PARAMETER .................................. 39
SPECIFYING A PAUSE .................................. 40
SPECIFYING DEGREES, RADIANS OR GRADIANS ............. 40
SELECT

General Form:

\[
\text{SELECT} \quad \text{select parameter} [, \text{select parameter} \ldots]
\]

where

\[
\text{select parameter} = \begin{cases} 
\text{CI} & \text{device address} \\
\text{CO} & \text{device address} [(\text{length})] \\
\text{TAPE} & \text{device address} \\
'\text{file number}' & \text{device address} \\
\text{LIST} & \text{device address} [(\text{length})] \\
\text{PRINT} & \text{device address} [(\text{length})] \\
\text{INPUT} & \text{device address} \\
\text{P} & [\text{digit}] \\
\text{D} & \text{} \\
\text{R} & \text{} \\
\text{G} & \text{}
\end{cases}
\]

\[
\text{device address} = \text{A three hexadecimal digit code specifying the desired device (see Device Address Table).}
\]

\[
\text{length} = \text{An integer < 256 specifying the desired carriage width.}
\]

\[
'\text{file number}' = \text{One of the following:} \\
\#1, \#2, \#3, \#4, \#5, \#6
\]

Purpose

The SELECT statement is used for three purposes:

1. To select device addresses for input/output statements or commands.
2. To specify a pause after every printed or displayed line of output (used mainly with CRT display), and
3. To specify degree, radian, or gradian measure for the trigonometric functions.
Section V  I/O Device Selection

A complete list of the System 2200S I/O devices and addresses is shown in the table below.

**DEVICE ADDRESSES FOR SYSTEM 2200S PERIPHERALS**  
(For further detail, see the individual peripheral manuals.)

<table>

</table>

* In some cases, more than one device address is listed for each device category. Unless otherwise noted, each peripheral device is assigned a unique address; device addresses are assigned sequentially. Therefore, if a System 2200S has only one device of a particular category, such as a cassette, it is set up with the first device address listed (10A in the case of the cassette). If it has two cassettes, they are set up with device addresses 10A and 10B. Each device address is printed on the interface card which controls that device.
Section V  I/O Device Selection

DEFAULT DEVICE ADDRESS SELECTION

Each System 2200S has three I/O devices designated as the Primary Console Devices for the system. The device addresses of these peripherals are built into the system such that whenever Master Initialization occurs (i.e., power is turned off and then on again), the system automatically is set to those device addresses for I/O operations. The Primary Console Devices normally are:

1. Primary Console INPUT Device: Keyboard (address 001) (Model 2215, 2222 or 2220)
2. Primary Console OUTPUT Device: CRT (address 005) (Model 2216) or 2220
3. Primary Console TAPE Device: The Primary Cassette (address 10A) (Model 2217 or 2220)

If a System 2200S does not contain additional input/output devices, then device addresses need not be specified or selected in the BASIC commands and statements which perform input/output. If additional devices are present in the system, device address specification or selection is required. Device selection is described in the remainder of this section.

When Master Initialization occurs, the Primary Console Device addresses are assigned to all input and output operations. This is, all commands, statements, and other information keyed into the System 2200S are done from the Primary Console Input Device, while all system output is sent to the Primary Console Output Device. All BASIC statements involving cassette operations automatically access the Primary Console Tape Device unless the statements contain either of the two optional parameters, #n, or/xxx, which supply the device address.

The console device addresses for input/output operations can be changed from the Primary Console Device addresses by using SELECT statements containing the parameters CI (console input), CO (console output), TAPE (console tape cassette drive). Before these parameters can be used, however, the device addresses of the new console devices must be known (see Device Address Table).

To change the console device from the Primary Output Device address (CRT device address = 005) to another output device, a statement having the following format can be used:

```
SELECT CO device address [(length)]
```

Example:
```
SELECT CO 215 (80)
```

This statement selects a line printer (device address = 215) as the new Console Output Device. The maximum line length to be used on the printer is set at 80 columns.

NOTE:
If a carriage width is not specified for console output, PRINT or LIST, the last carriage widths selected for these operations are used. Master Initialization sets these carriage widths to 64 characters.
Section V  I/O Device Selection

Example:

SELECT CO 005 (64)

This statement reselects the CRT as the Console Output Device. The line length is reset to 64 characters.

Example:

SELECT TAPE 10B

This statement selects the second cassette tape unit (device address = 10B) as the Console Tape Cassette unit. All statements involving cassette operations access the second cassette drive unless the statement contain either of the two optional parameters, #n or /xxx which supply the device address.

The System 2200S provides two other methods for selecting tape cassette drives or other devices for input and output operations. The individual BASIC statements that execute I/O operations (LOAD, DATASAVE, SKIP, etc.) each contain two optional parameters designated #n and /xxx. The /xxx parameter allows the actual device address of a cassette drive to be placed directly in the statement. The xxx represents the three-character device address of the desired device. This method of selecting tape devices is independent of the SELECT statement.

Example:

DATASAVE /10B, OPEN “DATFILE”

This statement writes a data file header record on the cassette whose device address is 10B.

The #n parameter permits cassette or other device addresses to be assigned indirectly using the SELECT statement. #n is called a file number and must be one of the following: #1, #2, #3. A particular device address can be assigned to a file number by a SELECT statement in a program. Thereafter in the program, BASIC Input/Output statements which contain that file number automatically use the previously assigned device address.

Example:

10 SELECT #2 10B, #3 10A

This statement assigns the cassette device address 10B to file #2, and the cassette device address 10A to file #3. In subsequent program statements which perform input/output operations, the file then can be used to supply the device address.

Example:

50  REWIND #2
60  DATALOAD #3, A( ), B$( )

The indirect assignment of device addresses in a program using file numbers offers several advantages. Subroutines can be written to perform a sequence of I/O operations for several devices. All device address assignments in a program can be changed by modifying a single statement. For instance, in the following example addresses can be assigned by changing statement 10.
Example:

10 SELECT #2 10B, #3 10A
20  SKIP #2, 2F
   ... 
100 REWIND #3
110 DATASAVE #2, OPEN "DATFILE"

THE INPUT AND PRINT PARAMETERS

The INPUT and PRINT parameters are used to select device addresses for the INPUT, KEYIN, PRINT, PRINTUSING, and HEXPRINT statements executed in a user's program. The INPUT select parameter specifies the device address to be used to enter data for INPUT and KEYIN statements.

Example:

100 SELECT INPUT 002
110 INPUT "VALUE OF X, Y", X, Y

The message "VALUE OF X, Y?" appears on the console output device, while the values of X and Y are keyed in on the keyboard whose device address is 002.

The PRINT parameter specifies the output device on which all program output from PRINT, HEXPRINT, and PRINTUSING statements are displayed.

Example:

100 SELECT PRINT 212 (100)
110 PRINT "X=";X,"NAME=";N$ 
120 PRINTUSING 121, V
121 %TOTAL VALUE RECEIVED:$#, ###. ##

The SELECT PRINT statement in line 100 directs all printed output to a Model 2201 Output Writer (device address 212); the carriage width is specified as 100 characters.

Example:

SELECT PRINT 005(64)

This statement reselects the CRT as the device to which all PRINT and PRINTUSING output is directed. The maximum line length is reset to 64 characters.

NOTE:

The output from PRINT statements entered in the immediate mode always appears on the Console Output Device.

THE LIST PARAMETER

The LIST select parameter specifies which output device is to be used for all program listings.

Example:

SELECT LIST 215(70)
Section V  I/O Device Selection

This statement specifies that a line printer (device address = 215) is to be used for program listings. The maximum line length is specified as 70 columns.

NOTE:
All SELECT statement formats are legal in either program mode or immediate mode. Device selections remain in force until:
1. They are changed by the execution of another SELECT statement, or
2. They are reset to the currently selected console devices by the execution of a CLEAR command with no parameter, or
3. They are reset to the Primary Console Devices by a Master Initialization.

A CLEAR command with no parameters and Master Initialization (power on) clears all file number assignments. All file numbers then must be initialized by re-executing the SELECT statements. Reference to an unassigned or cleared file number causes an error output.

WARNING: Selecting an illegal device address for CI or CO causes the system to become locked out; it can be reset only by Master Initializing, i.e., by turning the power off then on again. All programs and variables will be lost.

SPECIFYING A PAUSE:

The 'P' select pause parameter causes the system to pause each time a carriage return character is output to a CRT so the user can scan the output rather than programming the system to halt execution whenever the CRT screen is full. The optional digit following the pause specifies the length of the pause in increments of 1/6 seconds. For example, the following statements generated the indicated pauses:

100 SELECT P1  pause  = 1/6 seconds
SELECT P6  pause  = 1 second
SELECT P (or PO)  pause  = null (i.e., no pause)

Again, a pause remains in effect until Master Initialization occurs or until a different pause is selected. Selecting P or PO removes the current pause.

SPECIFYING DEGREES, RADIANS, OR GRADS:

Degree, radian, or gradian measure may be selected for the trig function arguments by using the 'D', 'R' or 'G' parameters, respectively. For example:

SELECT D

causes the system to use degree measure for the trigonometric functions. The unit of measure can be changed by executing another SELECT command or by Master Initialization, which automatically selects radians.

LIST ........................................... 49
RENUMBER .................................... 50
RESET ......................................... 51
RUN ............................................ 52
SPECIAL FUNCTION ......................... 53
STATEMENT NUMBER ....................... 55
INTRODUCTION

A BASIC command provides the user with a means for communicating with the system. A BASIC command facilitates the running or modification of a program but is not part of the program itself.

For example, the RUN command initiates the execution of a program in 2200S memory; the SAVE command instructs the system that all program text is to be recorded on a cassette tape.

BASIC commands are entered one line at a time. They differ from BASIC statements in that they are not preceded by line numbers, and only one command can be entered on one line; multiple commands separated by colons on one line are not allowed. BASIC program statements are saved in memory for later execution; BASIC commands cause action and are not saved.

All the 2200S BASIC commands are described on the following pages.

BASIC SYNTAX SPECIFICATION RULES

The following editorial rules are used in this manual to define and illustrate the components of BASIC program statements and system commands.

1. Uppercase letters (A through Z), digits (0 through 9) and special characters (*, /, +, etc.) must always be used for program entry exactly as they are shown in the general form.

2. Information in lowercase letters is to be supplied by the user; for example, in the statement GOSUB 'line number', the line number must be entered by the user.

3. Square brackets, [ ], indicate that the enclosed information is optional. For example,

   RESTORE [expression]

   means that the RESTORE statement verb can be optionally followed by an expression:

   RESTORE
   or    RESTORE 2+X

   are both legal forms.

4. Braces, {   }, enclosing vertically stacked items indicate that one of the items is required. For example,

   COM { scalar variable }
   { array variable }

   means that the COM statement elements can be:

   a scalar variable (i.e., C2)
   OR
   an array variable (i.e., D(4,8) )

5. Ellipsis, . . . , indicate that the preceding item may occur once or many times in succession. For example,

   INPUT variable, variable, . . .

6. Except within double quotation marks, BASIC syntax ignores blanks.

7. When one or more items appear in sequence, these items or their replacements must appear in the specified order.
Section VI  Non-Programmable Commands

GENERAL FORM OF TERMS
The list below defines the language syntax elements used in the command and statement syntax specifications.

alpha array designator :: = letter[ digit ] $ ( )
alpha array variable :: = letter [ digit ] $ ( expression , expression )
alpha scalar variable :: = letter [ digit ] $

alpha variable :: =
{alpha array variable
alpha scalar variable
STR function

array designator :: =
{alpha array designator
numeric array designator

builtin :: = one of the following function names: SIN, COS, TAN, ARCSIN, ARCCOS, ARCTAN, ATN, EXP, LOG, SQR, ABS, INT, SGN, RND, LEN.

color string :: = any string of letters, digits, or symbols not including carriage return, backspace, etc.
device address :: = hexdigit hexdigit hexdigit
digit :: = 0, 1, 2, 3, 4, 5, 6, 7, 8, or 9
exponent = E( { ± } ) digit [ digit ]
expression :: = [ { ± } ] term

fraction :: = . integer

function :: =
{FN ( { letter } ) ( expression )

hexdigit :: =
{ digit
{ A, B, C, D, E, or F

integer :: = digit [ digit . . . ]

line number :: = digit [ digit ] [ digit ]

literal string :: = { character string not including single quotes
\{HEX { hexdigit hexdigit . . .

number :: =
{ integer
{ fraction
integer fraction [ exponent ]
Section VI  Non-Programmable Commands

numeric array designator :: = letter [ digit ] ( )
numeric array variable :: = letter [ digit ] ( expression [, expression ] )
numeric scalar variable :: = letter [ digit ]
numeric variable :: = { numeric scalar variable }
                     = { numeric array variable }
STR function :: = STR( alpha variable , expression [, expression ] )

term :: = ( expression ) ± term
         = number * term
         = function / term
         = numeric variable ↑ term
variable :: = { numeric variable }
         = { alpha variable }
CLEAR

General Form:  

| CLEAR | P [ line number [ , line number ] ] | V | N |

Purpose

The CLEAR command reinitializes the user program text and variable areas. CLEAR with no parameters removes all program text and variables from the system. The current console devices are selected for all I/O operations (see SELECT). Also, pause and trace are turned off.

CLEAR V removes all variables (both common and noncommon) from memory.

CLEAR N removes all noncommon variables from the system; but names, attributes, and values of common variables are not changed.

CLEAR P removes program text from the system; variables are not disturbed. CLEAR P with no line numbers deletes all user program text from the system. CLEAR P with one line number deletes all user program lines from the indicated line through the highest numbered program line. If two line numbers are entered, all text from the first through the second line numbers, inclusive, is deleted.

Example:

CLEAR
CLEAR V
CLEAR N
CLEAR P 10, 20
CLEAR P 10
CLEAR P
CONTINUE

Purpose
This command continues program execution whenever the program has been stopped either by a STOP verb or the touching of the HALT/STEP key. The program continues with the program statement immediately following the last executed program statement.

NOTE:
An error message is displayed and execution does not continue if the user enters a CONTINUE command after:
1. A text or table overflow error has occurred.
2. A variable has been entered that has not previously been defined.
3. A CLEAR V or CLEAR N command has been executed.
4. Program text has been modified by a CLEAR, CLEAR P, or RENUMBER command having been executed, or a new program line having been entered.
5. The RESET key has been pressed.

Example:
CONTINUE
Section VI Non-Programmable Commands

HALT/STEP

### General Form

<table>
<thead>
<tr>
<th>General Form:</th>
<th>HALT/STEP</th>
</tr>
</thead>
</table>

### Purpose

1. If a program is executing, the HALT/STEP key stops execution after the completion of the current statement. Program execution, beginning with the next statement, can be continued by entering the CONTINUE command.

2. If a program is being listed, the HALT/STEP key stops the listing after the current statement has been listed.

3. The HALT/STEP key can be used to step through the execution of a program. If program execution has terminated due to the execution of a STOP verb or the touching of the HALT/STEP key, touching the HALT/STEP key again causes the next program statement to be listed and executed; execution then terminates. In multiple statement lines, those statements which have already been executed are not listed; however, the colons separating these statements are always displayed. The GOTO statement can be used in the immediate mode to begin stepping execution at a particular line number (see GOTO). However, protected programs may not be stepped.

### NOTE:

An error message is printed out and execution does NOT continue if the user attempts to STEP program execution after:

1. A text or table overflow error has occurred.
2. A variable has been entered that has not previously been defined.
3. A CLEAR V or CLEAR N command has been executed.
4. Program text has been modified by a CLEAR, CLEAR P, or RENUMBER command having been executed, or a new program line having been entered.
5. The RESET key has been pressed.

Suppose the following program is in memory:

**Example:**

```plaintext
:00 GOSUB 200
:100 PRINT "CALCULATE X, Y"
:110 X=1.2: Y=5*Z+X: GOTO 30
```

and we wish to step through the program from line 100 on. TRACE is turned on so that variables receiving new values are displayed.
HALT/STEP  (Continued)

Example:

Turn TRACE mode on
Start stepping at line 100
Touch HALT/STEP key

:TRACE
:GOTO 100

Touch HALT/STEP key

100 PRINT "CALCULATE X, Y"
CALCULATE X, Y

Touch HALT/STEP key

110 X=1.2: Y=5*Z+X: GOTO 30
X=1.2

Touch HALT/STEP key

110: Y=5*Z+X: GOTO 30
Y=21.6

HALT/STEP key

110: : GOTO 30
TRANSFER TO 30

:—
LIST

General Form: LIST [S] [line number [, line number ]]

Purpose
The LIST command instructs the system to display the entire program text in line number sequence. If one line number follows the command, then one program line is listed. If two line numbers follow the command, all text from the first through the second line numbers inclusive are listed.

The ‘S’ parameter is a special feature for the CRT terminal. It permits the listing of the program in steps of 15 lines (the maximum capacity of the CRT screen). After 15 lines have been generated, the listing can be continued. To continue listing (up to the limit specified in the LIST command), the CR/LF-EXECUTE key is pressed.

Pressing HALT/STEP during the listing of a program stops the listing after the current statement line has been finished.

Alternatively, the user may slow down listing on the CRT by selecting a pause of from 1/6 to 1 1/2 seconds by executing a SELECT P statement. A pause will occur after each line is listed.

When the 2200S is Master Initialized (Power off, Power on), the CRT is initially selected for LIST operations. Other printing devices may be selected for listing by using a SELECT LIST command. (See SELECT.)

Examples:

:LIST
30 READ A, B, C, M
.
.
990 END

or :LIST 30, 50
30 READ A, B, C, M
40 LET G=A*D-B*C
50 IF G=0 THEN 60

or :LIST 30
30 READ A, B, C, M

or :SELECT P3 Select a pause of 1/2 sec.
:LIST

or :LIST S
First 15 lines appear on the CRT; depressing the CR/LF-EXECUTE key lists the next
15 lines, and so on until the entire program has been listed.

RENUMBER

General Form: \text{RENUMBER} \ [\text{line number}] [,.\text{line number}] [.\text{integer}]

where $0 < \text{integer} < 100$

Purpose

The RENUMBER command renumbers the user program. The first line number is the starting number and specifies the first line to be renumbered in the program. All program lines with line numbers greater than or equal to the starting line number are renumbered. If no starting line number is specified, the entire program is renumbered. The second line number in a RENUMBER command is the new line number which is assigned to the first line to be renumbered; note that the new line number must be greater than the highest line number preceding that line in the program. For example, if we are to renumber the following program starting with line 12, the new number assigned to line 12 must be $> 10$ since line 10 precedes line 12 in the program.

\begin{quote}
Examples:
\begin{verbatim}
    READY
    :10  INPUT X
    :12  FOR I = 1 TO 10
    :14  PRINT X*I
    :16  IF I > 100 THEN 20
    :18  NEXT I
    :20  STOP
    :

    :RENUMBER 12, 20
    :LIST
    10  INPUT X
    20  FOR I = 1 TO 10
    30  PRINT X*I
    40  IF I > 100 THEN 60
    50  NEXT I
    60  STOP
\end{verbatim}
\end{quote}

The integer specified in the RENUMBER command is the increment between line numbers; if no integer is specified, the increment is assumed to be 10. If no new starting line number is specified, the new starting line number equals the increment.

\begin{quote}
\textbf{NOTE:}
All references to line numbers within the program; e.g., in \textsc{GOTO}, \textsc{GOSUB}, or \textsc{PRINTUSING} statements are modified.
\end{quote}

\begin{quote}
Examples:
\begin{verbatim}
RENUMBER
RENUMBER 100, 5
RENUMBER 100, 150, 5
RENUMBER 5
RENUMBER , , 5
\end{verbatim}
\end{quote}
RESET

General Form:               RESET

Purpose

The RESET button immediately stops program listing or execution, clears the CRT screen, resets all I/O devices and returns control to the user. The program text is not lost; all program variables are maintained with their current values. If the TRACE mode was on, it is turned off.

Normally, program execution is terminated by the HALT/STEP command after which a program can be continued. RESET, on the other hand, terminates immediate execution statements or commands and restores the system after a temporary malfunction. RESET can be used to terminate program execution, but the program cannot be continued. The program can be rerun by touching the RUN key.

NOTE:

RESET should only be used to terminate program execution if HALT/STEP fails.

If the system has undergone a temporary malfunction which cannot be corrected by RESET, Master Initialize the system by turning the power switch on the Power Supply Unit off, then on again. This, however, erases programs and data previously in the system.

Example:

RESET
RUN

General Form: RUN [line number]

Purpose
The RUN command initiates the execution of the user's program. The system verifies the currently loaded program; variables are scanned and new (not previously entered) common variables and all non-common variables are reset to zero. The pointer to the next data value (to be used in a READ statement) is reset to the first data value in the program. The program statements are then executed in line number sequence.

If a line number is specified, program execution begins at the specified line number without reinitializing program variables to zero; the variables are maintained at the last calculated values. This enables the user to continue a halted program. Program execution must not be started in the middle of a FOR/NEXT loop or a subroutine.

NOTE:
After a program has been entered or loaded, execution should be initiated by a RUN command to ensure that space is reserved for program variables. Once a program has been RUN, program execution may be restarted by pressing a special function key.

Examples:

RUN
RUN 30
SPECIAL FUNCTION

<table>
<thead>
<tr>
<th>General Form:</th>
<th>Special Function Key</th>
</tr>
</thead>
</table>

Purpose
There are 16 special function keys available on the 2215 (2222, 2220) keyboard. Depressing them in conjunction with the SHIFT key provides up to 32 entry points for the currently loaded BASIC program. The entry points are defined by the BASIC statement DEFFN’ XX (where XX = 00 to 31). Thus, depressing special function key 2 causes an entry and execution of a line or subroutine beginning with a DEFFN’ 2 statement. With this special entry, text strings can be entered or multi-argument subroutines can be executed.

If a special function key is defined for text entry, pressing the key causes the character string defined by the special function entry to be displayed and become part of the current text line (see DEFFN’).

For example, if special function key 2 is defined by the following statement:

```
100 DEFFN’ 2 "HEX"
```

pressing the special function key 2 after the following has been keyed in:

```
:20 PRINT
```

results in

```
:20 PRINT HEX
```

If a special function key is defined for marked subroutine entry (see DEFFN’), the subroutine can be executed either manually by depressing the indicated special function key, or by using a GOSUB’ statement (see GOSUB’) within a program. Arguments are passed to the subroutine either by keying them in, separated by commas, immediately before the special function key is pressed, or by indicating them as parameters in the GOSUB’ statement. The number of arguments passed must equal the number of variables in the DEFFN’ statement marking the subroutine. When a RETURN statement is finally executed, control is passed back to the keyboard or to the program statement immediately following the GOSUB’ statement.

The special Function Keys also can be used to provide program entry points which cause execution of a portion of a program which is not terminated by a RETURN statement. In this case, however, a RETURN CLEAR statement must be provided in the program following the DEFFN’ entry statement to clear the subroutine return information setup by the special function entry.

**Example:**

```
:12.3, 3.24, "JOHN" (Depress special function key 3.)
```

causes the following subroutine to be executed:

```
:100 DEFFN’ 3 (A, B, C$)
:110 ...
:120 ...
... where A is set to 12.3
:200 RETURN
```

B is set to 3.24
C$ is set to "JOHN"

53
Examples:

Provide a non-returning program entry point on Special Function Key 2:

:100 DEFFN’ 2
:110 RETURN CLEAR
:200 STOP

Define the special function key 0 to execute the following:

\[ Z = 7X^2 + 14Y^2 - 7 \]

READY
:10 DEFFN’ 0 (X, Y)
:20 Z = 7 \times X^2 + 14 \times Y^2 - 7
:30 PRINT "\(X=\);X
:40 PRINT "\(Y=\);Y
:50 PRINT "\(Z=\);Z
:60 RETURN

Execute the subroutine for

\(X=0.092\) and \(Y=-0.32\)

Solution:

(A) MANUAL ENTRY
Key .092, −.32
Touch special function key 0.
CRT Display:
:092, −.32
X= 9.20000000E−02
Y= −.32
Z= 5.507152

(B) PROGRAM ENTRY
READY
:100 GOSUB’ 0 (.092, −.32)
:110 STOP
:RUN 100
X = 9.20000000E−02
Y = −.32
Z = 5.507152
STOP
Purpose
This key automatically sets the line number of the next line to be entered. The line number generated is 10 more than the highest existing line number.

The statement number can also be keyed in manually, using the numeric entry keys. Statement numbers can be any integer from 1 to 4 digits.

Statements may be entered in any order; however, they are usually numbered in increments of five or ten so additional statements can be easily inserted. The system keeps them in numerical order regardless of how they are entered.

Example:

READY
{:10 X, Y, Z = 0
{:20 INPUT "ENTER VALUES", A, B
{:30 Z = A*B + B^2
{:40...

Section VII  General BASIC Statements

BASIC STATEMENTS
A BASIC statement is a special verb or word followed by an expression, variable, or numbers. For example:

READ A, B    A statement: verb followed by variables
DATA 1, 4    A statement: verb followed by values
LET A = 6*B   A statement: verb followed by a variable (A),
an equals sign, and an expression (6*B).

BASIC statement lines in a program must always begin with a line number; statement lines in the immediate mode do not require line numbers.

There are two types of BASIC statements: executable and non-executable. An executable statement specifies program action:

:10  READ A, B
:20  A = 6*B
:

A non-executable statement provides information for program execution:

:10  DATA 1, 4
:

or for the programmer:

:20  REM THIS IS PROGRAM 1
:

A series of statements, separated by colons, may be entered on one line.

Example:

:20  FOR I = 1 TO 10 :PRINT I,X(I)*Y :NEXT I
:

or:

:FOR J = 1 TO 3 :PRINT J,J+2, J+3 :NEXT J

1     1    1
2     4    8
3     9    27
:

The remainder of this section defines the general BASIC statements available in the System 2200S for programming and the formats in which they can be used.
COM

<table>
<thead>
<tr>
<th>General Form:</th>
<th>COM com element [ , com element ...]</th>
</tr>
</thead>
<tbody>
<tr>
<td>where</td>
<td>numeric scalar variable</td>
</tr>
<tr>
<td>com element</td>
<td>numeric array variable</td>
</tr>
<tr>
<td></td>
<td>alpha scalar variable [integer]</td>
</tr>
<tr>
<td></td>
<td>alpha array variable [integer]</td>
</tr>
<tr>
<td></td>
<td>0 ≤ integer ≤ 64</td>
</tr>
</tbody>
</table>

Purpose

The COM statement allows a programmer to store information in memory in an area which can be saved for use in a subsequent program. When a program is run, previously existing common variables and their values are not disturbed. However, all non-common variables are cleared from memory. Common variables are only removed from the system when a CLEAR or CLEARV command is executed or the system is master initialized (i.e., turned on). The COM statement also provides array definition identical to the DIM statement for array variables; the syntax for one COM statement can be a combination of array variables (A(10), B(3,3)) and scalar variables (C2, D, X$). Integers must be used for array dimensions.

The common area variables must be defined before any other variable in the program is defined. Therefore, COM statements should be assigned the lowest executable line numbers in the program.

The following general rules apply to the COM statement:

1. Common variables must be named with identical attributes in a previous program.
2. Common variables must be defined before any noncommon variables are defined, or referred to in the program.
3. The number of array elements must not exceed 4096 in any one array.

The COM statement can be used to set the maximum length of alphanumeric variables (the maximum length is assumed to be 16 if not specified). The integer (≤ 64) following the alpha scalar (or alpha array) variable specifies the maximum length of that alpha variable (or those array elements).

If a particular set of common variables are to be used in several sequentially run programs, the COM statements do not have to appear in any program other than the first. The variables will remain defined as common variables with the originally defined dimensions, lengths and values in subsequent programs. The COM statements may however, be included in subsequent programs (with identical dimensions and lengths) and new common variables may be defined.

Examples:

10   COM A(10), B(3,3), C2
20   COM C, D(4,14), E3, F(6), F1(5)
30   COM M1$, M$(2,4), X,Y
40   COM A$10, B$(2,2) 32

58
## CONVERT

**General Form:**

1. CONVERT alpha variable TO numeric variable  
   or  
2. CONVERT expression TO alpha variable, (image)

where: image = [±] [#. . .] [. ] [# . . .] [↑↑↑↑]

0 < number of #’s < 14

### Purpose

**Alpha-to-Numeric Conversion**

The CONVERT statement used with format 1 converts the number represented by ASCII characters in the alphanumeric variable to a numeric value and sets the numeric variable equal to that value. For example, if A$ = “1234”, CONVERT A$ TO X sets X = 1234. An error results if the ASCII characters in the specified alphanumeric variable are not a legitimate BASIC representation of a number. Part of an alphanumeric value can be converted to numeric by using the STR function. For example,

\[
\text{CONVERT STR(A$, 1, 8) TO X}
\]

Alpha-to-numeric conversion is particularly useful when numeric data is read from a peripheral device in a record format that is not compatible with normal BASIC DATALOAD statements, or when a code conversion is first necessary. It also can be useful when it is desirable to validate keyed-in numeric data under program control. (Numeric data can be received in an alphanumeric variable, and tested with the NUM function before converting it to numeric.)

**Numeric-to-Alphabetic Conversion**

The CONVERT statement used with format 2 converts the numeric value of the expression to an ASCII character string according to the image specified; the alphanumeric variable is set equal to that character string. The image specifies precisely how the numeric value is to be converted. Each character in the image specifies a character in the resultant character string. The image is composed of # characters to signify digits and optionally +, −, ., ↑, characters to specify sign, decimal point, and exponent characters.

The image can be classified into two general formats:

<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fixed Point e.g., #.##</td>
</tr>
<tr>
<td>2</td>
<td>Exponential e.g., #.#↑↑↑</td>
</tr>
</tbody>
</table>

Numeric values are formatted according to the following rules:

1. If the image starts with a plus (+) sign, the sign of the value (+ or −) is edited into the character string.
2. If the image starts with a minus (−) sign, a blank for positive values and a minus (−) for negative values is edited into the character string.
3. If no sign is specified in the image, no sign is included in the character string.
4. If the image has format 1, the value is edited into the character string as a fixed point number, truncating or extending with zeroes any fraction, and inserting leading zeroes according to the image specification. The decimal point is edited in at the proper position. An error results if the numeric value exceeds the image specification.
5. If the image has format 2, the value is edited into the character string as a floating point number. The value is scaled as specified by the image (there are no leading zeroes). The exponent is always edited in the form: E ± XX.
CONVERT  (Continued)

Numeric to Alpha conversion is particularly useful when numeric data must be formatted in character format in records (especially for alphanumeric sorting).

Examples:
10 CONVERT A$ TO X  
20 CONVERT STR(A$, 1, NUM(A$)) TO X(1)

Examples:
(numeric to alpha)
10 CONVERT X TO A$, (###)  
   (result: A$ = "012")  
   (where: X = 12.195)
20 CONVERT X*2 TO A$, (+##.##)  
   (result: A$ = "24.39")
30 CONVERT X TO STR(A$, 3, 8), (−#,#↑↑↑)  
   (result: STR(A$, 3, 8) = "1.2E+01")  
40 CONVERT X TO A$, (++##.####)  
   (result: A$ = "0012.195000")
DATA

General Form: 
```
DATA n [ ,n ... ]
where n = number or a character string enclosed in quotation marks.
```

Purpose
The DATA statement provides the values to be used by the variables in a READ statement. In effect, the READ and DATA statements provide a means of storing tables of constants within a program. Each time a READ statement is executed in a program the next sequential value(s) listed in the DATA statements of the program are obtained and stored in the variable(s) listed in the READ statement. The values entered with the DATA statement are in the order in which they are to be used: items in the DATA list are separated by commas. If several DATA statements are entered, they are used in order of statement number. Numeric variables in READ statements must reference numbers; alphanumeric variables must reference literal strings, which must be enclosed in quotation marks.

The RESTORE statement provides a means of resetting the current DATA statement pointer (i.e., reusing the DATA statement values) (see RESTORE).

The DATA statement may not be used in the immediate mode.

Example:
```
:10  READ W
:20  PRINT W, W↑2
:30  GOTO 10
:40  DATA 5, 8.26, 14.8, -687, 22
:RUN
5    25
8.26 68.2276
14.8 219.04
-687 471969
22    484
10  READ W
       ↑ERR27  (insufficient data)
```

In the above example, the 5 values listed in the DATA statement are sequentially used by the READ statement and printed. When a 6th value is requested, an error is displayed since all DATA statement values have been used.

Examples:
```
40  DATA 4, 3, 5, 6
50  DATA 6.56E + 45, -644.543
60  DATA "BOSTON, MASS", "SMITH", 12.2
```

NOTE:
On the 2200S, statements following DATA statements on multiple statement lines are not executed.
DEFFN

General Form:

DEFFN a(v) = expression
where a = a letter or digit which identifies the function
v = a numeric scalar variable

Purpose

The DEFFN statement defines a user’s unique functions. The DEFFN statement is used to define functions which can be used in expressions from any other part of the program. The function provides one dummy variable whose value is supplied when the function is referenced. The following program lines illustrate how DEFFN is used.

:10  X = 3
:20  DEFFN A(Z) = Z12 – Z
:30  PRINT X + FNA (2*X)
:40  END
:RUN
33

Processing of Line 30:

1. Evaluate the expression for the scalar variable (i.e., 2*X).
2. Find the DEFFN with the matching identifier (i.e., A).
3. Set the scalar variable equal to the evaluated expression value (i.e., Z=2*X =6, since X=3)
4. Evaluate the FN expression and return the calculated value (i.e., Z12 – Z).

The above example prints the value 33, 3 + (612 – 6).

The DEFFN statement may be entered any place in a program, and the expression may be any formula which can be entered on one line. A function cannot refer to itself; it can refer to other functions. Up to five levels of function nesting are permitted. Two functions cannot refer to each other (an endless loop). A reference cannot be made to a DEFFN statement from an immediate mode statement. The scalar variable used in a DEFFN statement is called a dummy variable. It may have a variable name identical to a real variable used elsewhere in the program or in other DEFFN statements; current values of these variables are not affected during FN evaluation.

Examples:

60  DEFFN A (C) = (3*A) – 8C + FNB (2-A)
70  DEFFN B (A) = (3*A) – 9/C
80  DEFFN4(C) = FNB(C) * FNA(2)
### DEFFN'

**General Form:**
```
DEFFN' integer ["character string"
   (variable [, variable . . .])]
```

Where
- `integer` = 0 to 31 for keyboard special function key entries
- 0 to 255 for internal program references

**Purpose**

The DEFFN' statement has two purposes:

1. To define a character string to be supplied when a special function key is used for keyboard text entry.
2. To define keyboard special function key or program entry points for subroutines with argument passing capability.

The DEFFN' statement must be the first statement on a line (i.e., it must immediately follow the line number). DEFFN' may not be used in immediate mode.

**KEYBOARD TEXT ENTRY DEFINITION:** The integer in the DEFFN' statement must be a number from 0 to 31, representing the number of a special function key. When the corresponding special function key is depressed, the user’s “character string” is displayed and becomes part of the currently entered text line. The character string is all characters included between the double quotation marks.

For example, statement 100 defines special function key number 12 as the character string "HEX()":

```
:100   DEFFN' 12 "HEX()"
```

Depressing special function key number 12 after the following has been keyed in

```
:200   PRINT
```

results in the following line being displayed

```
:200   PRINT HEX()
```

**Example:**

```
      500 DEFFN' 1 "REWIND"
```

**MARKED SUBROUTINE ENTRY DEFINITION**

The DEFFN' statement, followed by an integer and an optional variable list enclosed in parentheses, indicates the beginning of a marked subroutine. The subroutine may be entered from the program via a GOSUB' statement (see GOSUB'), or from the keyboard by depressing the appropriate special function key. If subroutine entry is to be made via a GOSUB' statement, the integer in the DEFFN' statement can be any integer from 0 to 255; if the subroutine entry is to be made from a special function key, the integer can be from 0 to 31. When a special function key is depressed or a GOSUB' statement is executed, the BASIC program is scanned for a DEFFN' statement with an integer corresponding to the number of the special function key or the integer in the GOSUB' statement. Execution of the program then begins at the statement (i.e., if special function key 2 is depressed, execution begins at the DEFFN' 2 statement).

When a RETURN statement is encountered in the subroutine, control is passed to the program statement immediately following the last executed GOSUB' statement, or back to keyboard entry mode if entry was made by touching a special function key. The DEFFN' statement may optionally include a variable list. The
variables in the variable list receive the values of arguments being passed to the subroutine; if the number of arguments to be passed is not equal to the number of variables in the list, an error results. In a GOSUB' subroutine call made internally from the program, arguments are listed (enclosed in parentheses and separated by commas) in the GOSUB' statement (see GOSUB').

Example:

```
:100  GOSUB' 2 (1.2, 3+2 * X, "JOHN")

:150  STOP
:200  DEFFN' 2 (A, B(3), C$)

:290  RETURN
```

For special function key entry to a subroutine, arguments are passed by keying them in, separated by commas, immediately before the special function key is depressed.

Example:

```
:1.2, 3.24, "JOHN" (now depress special function key 2)
```

The DEFFN' statement need not specify a variable list. In some cases, it may be more convenient to request data from a keyboard in a prompted fashion.

Example:

```
100  DEFFN' 4
110  INPUT "RATE", R
120  C = 100 * R - 50
130  PRINT "COST="; C
140  RETURN
```

When a DEFFN' subroutine is executed via keyboard special function keys while the system is awaiting data to be entered into an INPUT statement, the INPUT statement will be repeated in its entirety, upon return from the subroutine.

Example:

```
100  INPUT "ENTER AMOUNT", A

200  DEFFN' 1
210  INPUT "ENTER NEW RATE", R
220  RETURN
```

DISPLAY: ENTER AMOUNT?
(Depress Special Function Key 1)
ENTER NEW RATE? 7.5
ENTER AMOUNT?
DEFFN' (Continued)

DEFFN' subroutines may be nested (i.e., call other subroutines from within a subroutine).

NOTE:

The DEFFN' statement may be used in conjunction with the special function keys to provide a number of entry points to run a program. Because, however, the system stores DEFFN' return information in a table, this should not be done repetitively unless:

1. The RESET key is depressed prior to the special function key.
2. Program operation terminates with a RETURN statement (back to keyboard mode).

Failure to do this eventually causes a table overflow error (ERROR 02).
**DIM**

**General Form:**

\[
\text{DIM } \text{dim element [ , dim element ...]} \text{ where dim element = } \begin{cases} 
\text{numeric array variable} \\
\text{alpha array variable [integer]} \\
\text{alpha scalar variable [integer]} 
\end{cases} \\
0 < \text{integer } \leq 64
\]

**Purpose**

The DIM statement reserves space for one or two dimensional array variables which are referenced in the program. Space may be reserved for more than one array with a single DIM statement by separating the entries for array names with commas as shown in line 40 of the example below.

DIM statements must appear before any use of the variables in the program, and the space to be reserved must be explicitly indicated -- expressions are not allowed.

The following rules apply to the use and assignment of array variables in a DIM statement.

1. The numeric value of the subscript of the first element must be 1; zero is not allowed.
2. The dimension(s) of an array cannot exceed 255; the dimensions must be integers.
3. The number of array elements must not exceed 4096 in any one array.

The DIM statement can also be used to set the maximum length of alphanumeric variables (the maximum length is assumed to be 16 if not specified). The integer (< 64) following the alphanumeric variable or alpha array variable specifies the maximum length of that alpha variable (or those alpha array elements).

**Examples:**

20 DIM I(45)  
Reserves space for a 1-dimensional array of 45 elements.

30 DIM J (8, 10)  
Reserves space for a 2-dimensional array of 8 rows and 10 columns.

40 DIM K(35), L(3), M(8,7)  
Reserves space for two 1-dimensional and one 2-dimensional array.

50 DIM A$32  
Sets the maximum length of the variable A$ = 32 characters.

60 DIM B$(4,4) 10  
Reserves space for the 2-dimensional alpha array with the maximum length of each array element = 10 characters.
Section VII General BASIC Statements

END

| General Form: | END |

Purpose
This is an optional program statement indicating the end of a BASIC program. It need not be the last executable statement in a program. More than one END statement may be used in a program.

When the system executes an END statement, the following message is printed out.

```
END PROGRAM
FREE SPACE = xxxxx
```

and program execution terminates. "xxx" is the approximate amount of memory (in bytes) not used by this program.

In addition, when a program is being keyed into the system, an END statement may be entered without a line number (immediate mode) to obtain the FREE SPACE available at any particular time in the system.

Example:
```
:100  X=24 - 2*4
:110  PRINT Y,X
:END
END PROGRAM
FREE SPACE = 2379
```

The amount of free space displayed when END is executed is determined in two different ways:

1. When program is keyed in or loaded from a tape or other peripheral device following a CLEAR command, the free space displayed after entering an END statement in immediate mode reflects only the space occupied by the program.

2. After the program has been executed once, the free space displayed after either an immediate mode END or a program executed END reflects both the space taken up by the program and variables.

Example:
```
999 END
```
FOR

General Form: FOR v = expression TO expression [STEP expression]  
where v = a numeric scalar variable

Purpose

The FOR statement, and the NEXT statement, are used to specify a loop. The FOR statement is used at the beginning of the loop; the NEXT statement at the end. The program lines in the range of the FOR statement are executed repeatedly, beginning with \( v = \text{1st expression} \); thereafter, \( v \) is incremented by the value specified in the STEP expression until the value of \( v \) passes the limit specified by the TO expression. The STEP portion of the statement may be positive or negative or may be omitted. If omitted, a step size of +1 is assumed. Loops may be nested with no limit.

If illegal values are assigned to the parameters in a loop (i.e., if the increment designated by STEP is in the wrong direction or 0), the loop is executed once only and program execution continues. Examples of invalid values are:

- FOR R = 1 TO 10 STEP -1  Wrong Direction of STEP Expression.
- FOR R = -1 TO -10 STEP 1   Wrong Direction of STEP Expression.
- FOR R = 1 TO 10 STEP 0     STEP Expression equals 0.

A loop is executed to completion only if the values assigned the parameters are valid. The following restrictions apply to the use of FOR loops:

1. Branching into the range of a FOR loop from the loop is not permissible (GOTO, GOSUB, IF-THEN).
2. Branching out of range of a FOR loop is permissible; however, to conserve memory, it should not be done repeatedly unless a subsequent normal termination of an outer loop occurs or unless the loop is completely contained in a GOSUB routine. If repetitive branches are made out of FOR loops, without terminating the loops, the FOR loop information is accumulated in an internal compiler table. This eventually causes a table overflow condition (ERROR 02). See examples illustrating legal branches out of a loop.
3. Branching out of a FOR loop with a RETURN statement is legal but the loop is considered to be complete (i.e., branching back into the loop is illegal and an error message is issued when the NEXT statement is encountered).

Example:

```
READY
:20 FOR Z3 = A(K) TO -COS(J) STEP -8 + INT(P(2))
:30 R(Z3) = A(K) + A(Z3)
:40 FOR Z4 = R(Z3) TO A(K) : Q(Z4) = 2*Z4*R(Z3)
:50 PRINT Q(Z4), "VALUE", FN6(Q(Z4))
:60 NEXT Z4: NEXT Z3
```
FOR (Continued)

Example:

:100 FOR I = 1 TO X
:110 IF A(I) > 100 THEN 130
:120 L = X; NEXT I; GOTO 200
:130 M = M + A(I) - B(I)
:140 NEXT I

......

:200 C = M * 100/I

Example:

READY
:20 FOR X = 1 TO 50
:30 PRINT X, SQR(X)
:40 NEXT X

Example:

READY
:50 GOTO 70
:60 FOR I = 1 TO 10 STEP 2
:70 LET (Z(I)) = FNA(I) - LOG(I)
:90 NEXT I

:100 FOR J = 1 TO 4
:110 FOR K = 1 TO 6
:120 IF Z(K) > 10 THEN 160
:150 NEXT K
:160 NEXT J
:200 GOSUB 300

......

FOR Loop within a GOSUB routine

:300 FOR X = .1 TO Z STEP .05
:340 IF A(I) < 3.25 THEN 400
:390 NEXT X
:400 RETURN

Illegal branch into a FOR loop

Proper branches out of a FOR loop

Legal branch out of FOR loop which properly terminates loop to avoid accumulation of FOR loop information in internal compiler stack.
GOSUB

General Form:  GOSUB line number

Purpose

The GOSUB statement is used to specify a transfer to the first program line of a subroutine. The program line may be any BASIC statement, including a REM statement. The logical end of the subroutine is a RETURN statement which directs execution of the system to the statement following the last executed GOSUB. The RETURN statement must be the last executable statement on a line, but may be followed by non-executable statements as shown below:

```
READY
:120 X = 20: GOSUB 200: PRINT X
:125
.
.
:200 REM SUBROUTINE BEGINS
.
.
:210 RETURN: REM SUBROUTINE ENDS
```

The GOSUB statement may be used to perform a subroutine within a subroutine (i.e., a nested GOSUB). This statement may not, however, be used to branch a program within a FOR loop where a NEXT statement encountered before a RETURN statement is encountered. Use of GOSUB is not permitted in the immediate mode; a GOSUB statement may not be the last statement in a program.

Repetitive entries to subroutines without executing a RETURN should not be made. Failure to RETURN causes RETURN information to be accumulated in a table which eventually causes a table return causes RETURN information to be accumulated in a table which eventually causes a table overflow error, (ERROR 02).

Example:

```
READY
:10 GOSUB 30
:20 PRINT X: STOP
:30 REM THIS IS A SUBROUTINE
:40 --
:50 --
:60 --
:70 --
:90 RETURN: REM END OF SUBROUTINE
```

The subroutine

70
GOSUB (Continued)

NESTED SUBROUTINES

```
READY
:10 GOSUB 30
:20 READ Q: STOP
:30 REM THIS IS A SUBROUTINE
:40
:50
:70 GOSUB 150
:80 PRINT Q
:90 --
:100 RETURN: REM END OF SUBROUTINE 30
:110
...
:150 REM THIS IS A NESTED SUBROUTINE
...
...
:200 RETURN: REM END OF NESTED SUBROUTINE--
```

Illegal GOSUB Transfer into FOR Loop

```
READY
:500 GOSUB 750
...

FOR Loop

:700 FOR I = 20 TO 50
...
:750 LET A(I) = LOG(12*A) - Z(I)
:760 NEXT I
:770 RETURN
```

Restriction:
If a GOSUB to any line number of the form xx22, xx27, 22xx, or 27xx precedes a STOP statement in a statement line and a statement follows STOP on the same line, ERR 11 will result if the user attempts to continue program execution after STOP.

Also, if one of the above mentioned line number references precedes an INPUT statement, ERR 11 will result if the user presses a Special Function Key during the input request.

For example,
```
:10 GOSUB 2700: INPUT A$
:20 END
:100 DEFFN'0: PRINT "SF' 0": RETURN
:2700 PRINT "2700": RETURN
:RUN
2700
SF'0
↑ ERR 11
```
GOSUB'

General Form: GOSUB' integer [{ subroutine argument [ , subroutine argument ... ]}]
where 0 ≤ integer < 256

subroutine argument = { character string in quotes }
{ alphanumeric variable }
{ expression }

Purpose

The GOSUB' statement specifies a transfer to a marked subroutine rather than to a particular program line as with the GOSUB statement; a subroutine is marked by a DEFFN' statement (see DEFFN'). When a GOSUB' statement is executed, program execution transfers to the DEFFN' statement having an integer identical to that of the GOSUB' statement (i.e., GOSUB' 6 would transfer execution to the DEFFN' 6 statement). Execution continues until a subroutine RETURN statement is executed. The rules applying to GOSUB usage also apply to the GOSUB' statement. Unlike a normal GOSUB, however, a GOSUB' statement can contain arguments whose values can be passed to variables in the marked subroutine.

The values of the expressions, literal strings, or alphanumeric variables are passed to the variables in the DEFFN' statement (see DEFFN').

Use of GOSUB' is not permitted in immediate execution mode; GOSUB' may not be the last statement in a program.

Repetitive entries to subroutines without executing a RETURN should not be made. Failure to return causes return information to accumulate in a table which could eventually cause table overflow error, (ERROR 02).

Example:

```
READY
:100 GOSUB' 7
:150 END
:200 DEFFN' 7 :SELECT PRINT 211 (80)
:210 RETURN
:--; Example:
```

```
READY
:25 GOSUB' 12 ("JOHN", 12.4, 3*X+Y)
:30 END
:100 DEFFN' 12 (A$,B,C(2))
:110 PRINT A$,B,C(2)
:120 RETURN
:--; Example:
```
GOTO

General Form:

GOTO line number

Purpose

This statement transfers execution to another area of the program. The GOTO statement directs the system to the line number where execution is to continue.

The GOTO statement can also be used in the immediate mode to permit the user to begin stepping through program execution from a particular line number. The GOTO statement sets the system at the specified line; execution does not take place until the user touches the HALT/STEP key.

Example:

READY
:10 J=25
:20 K=15
:30 GOTO 70
:40 Z=J+K+L+M
:50 PRINT Z, Z/4
:60 END
:70 L=80
:80 M=16
:90 GOTO 40
:RUN
136 34
END PROGRAM
FREE SPACE = 3841
**HEXPRINT**

**General Form:**

```
HEXPRINT {alpha variable
alpha array designator}
{[; ]}{alpha variable
alpha array designator}...
```

where:

- alpha array designator = alpha array name ( )  e.g., A$( )

**Purpose**

This statement prints the value of the alpha variable or the values of the alpha array in hexadecimal notation. The printing or display is done on the device currently selected for PRINT operations (see SELECT). Trailing spaces, HEX(20), in the alpha values are printed. Arrays are printed one element after another with no separation characters. The carriage return is printed after the value(s) of each alpha variable (or array) in the argument list, unless the argument is followed by a semi-colon. If the printed value of the argument exceeds one line on the CRT display or printer, it is continued on the next line or lines. Since the carriage width for PRINT operations can be set to any desired width by the SELECT statement, this could be used to format the output from arguments which are lengthy.

**Example:**

```plaintext
:10  A$ = "ABC"
:20  PRINT "HEX VALUE OF A$="; 
:30  HEXPRINT A$ 
:RUN

HEX VALUE OF A$=414243202020202020202020202020
```

**Examples:**

```plaintext
:100  HEXPRINT A$, B$(1), STR(C$, 3, 4) 
:110  HEXPRINT A$; B$; 
:120  HEXPRINT X$( )
```
Section VII  General BASIC Statements

IF END THEN

General Form:  IF END THEN line number

Purpose
This statement is used to sense an end of file (i.e., trailer record) when reading data files. If an end of file (trailer record) has been encountered during the last data file read operation (DATALOAD), a transfer is made to the specified line number. The end-of-file condition is reset by the IF END statement, any subsequent DATALOAD operation, or when program execution is initiated. When a trailer record is read, during a DATALOAD statement, it causes the end-of-file indicator to be set and variables in the DATALOAD argument list to remain unchanged.

Example:

READY
:100 DATALOAD A, B, C$
:110 IF END THEN 130
:120 GOTO 100
:130 PRINT A, B, C$
:___
Purpose
The IF statement causes the system to skip the normal sequence of program lines and go to the line number following THEN, provided certain conditions are met. This may be described as a conditional GOTO statement, which compares two items.

If the value of the first item in the IF statement is in the specified relationship to the second item, program execution goes to the line number following THEN. If the specified relationship is not met, the program execution continues with the next statement.

If two alphanumeric values are being compared, the "<" relational operator is interpreted as "earlier in alphabetic order". Actually, the ASCII codes of the characters in the strings (see Appendix C) are compared; 1 is less than A since the ASCII code for 1 is 31 and the ASCII code for A is 65. In any comparison, trailing blanks are ignored, thus, "YES" = "YES". An error results if numeric values are compared to alphanumeric values.

The IF statement cannot be used in the immediate mode.

Examples:

40 IF A < B THEN 35
50 IF A$ = "YES" THEN 100
60 IF A$=HEX(8082) THEN 200
70 IF X(1) < > .001 THEN 350
80 IF STR(A$, 1, 3) < B$(1) THEN 500
Image (%)

General Form: \[ \% t \{ \text{ft} \} \ldots \]  
where \( t \) = a literal string (not containing # characters) or blank  
\[ f, \text{format specification} = \left[ + \right] [\#, \ldots] [.\ldots] [\#\ldots] [\text{#\ldots}] \]

Purpose

This statement is used in conjunction with a PRINT USING statement to provide an image line for formatted output. The Image statement contains text to be printed, along with the format specifications used to format print elements contained in the PRINT USING statement.

The Image statement may have any printable characters of text inserted before and after print element format specifications. All text characters in the Image statement are printed as long as the final format specification is used. Each format specification in an Image statement is identified by at least one # character. The format specification may begin with the following characters ($, +, -, \cdot, \#$). Commas (,) may be embedded in the integer portion of the format specification (after the first # character but before the decimal point (.) or up arrow symbols (↑↑↑↑))

The Image statement must be the only statement on the statement line.

Example:

READY
:140% CODE NO. = ##### COMPOSITION = ## ###
:670% ##### UNITS AT $#.####.## PER UNIT
:800% +#.####↑↑↑
INPUT

General Form: \[ \text{INPUT ["character string"], variable [, variable ...]} \]

Purpose

This statement allows the user to supply data during the execution of a program already stored in memory. If the user wants to supply the values for A and B while running the program, he enters, for example,

\[ :40 \text{ INPUT A,B} \]

or

\[ :40 \text{ INPUT "VALUE OF A,B", A,B} \]

before the first program line which requires either of these values (A, B). When the system encounters this INPUT statement, it types the optional input required message, VALUE OF A, B, and a question mark (?) and waits for the user to supply the two numbers. Program execution then continues. The input request message is always printed on the console output device. The device used for inputting data is the console input device unless another device has been specified by using the SELECT INPUT statement (see SELECT).

Each value must be entered in the order in which it is listed in the INPUT statement. If more than one value is entered on a line, they may be separated by commas or entered on separate lines. Several lines may be used to enter the required INPUT data.

If there is a system-detected error in the entered data, the value must be reentered, beginning with the erroneous value. The values which precede the error are accepted.

A user may terminate an input sequence without supplying all the required input values by simply entering a carriage return with no other information preceding it on the line. This causes the system to immediately proceed to the next program statement. The INPUT list variables which have not received values remain unchanged.

When inputting alphanumeric data, the literal string need not be enclosed in quotes. However, leading blanks are ignored and commas act as string terminators. If leading blanks or commas are to be included, enclose the string in quotes.

Example 1:

\[ :10 \text{ INPUT X} \]
\[ \text{RUN} \]
\[ ?12.2 \text{ CR/LF} \]

Example 2:

\[ :20 \text{ INPUT "X,Y", X,Y} \]
\[ \text{RUN} \]
\[ X,Y? 1.1, 2.3 \text{ CR/LF} \]

Example 3:

\[ :20 \text{ INPUT "MORE INFORMATION", A$} \]
\[ :30 \text{ IF A$="NO" THEN 50} \]
\[ :40 \text{ INPUT "ADDRESS", B$} \]
\[ \text{RUN} \]
\[ \text{MORE INFORMATION? YES CR/LF} \]
\[ \text{ADDRESS? "BOSTON, MASS" CR/LF} \]
Example 4:

:10 INPUT "ENTER X", X
:RUN
ENTER X? 1.2734 CR/LF

SPECIAL FUNCTION KEYS IN INPUT MODE

Special function keys may be used in conjunction with INPUT. If the special function key has been defined for text entry (see DEFFN') and the system is awaiting input, depressing the special function key causes the character string associated with that key to be entered.

For example:

:10 DEFFN' 01 "COLOR T.V."
:20 INPUT A$
:RUN
?

Now, pressing special function key '01 will cause "COLOR T.V." to be entered.

? COLOR T.V.

CRT Cursor

If the special function key is defined to call a marked subroutine (see DEFFN') and the system is awaiting input, depressing the special function key causes the specified subroutine to be executed. When the subroutine RETURN is encountered, a branch made back to the INPUT statement and the INPUT statement is executed again. Repetitive subroutine entries via special function keys should not be made unless the subroutine RETURN is always executed. Failure to return from these entries causes return information to accumulate in a table and eventually cause a table overflow error (ERROR 02).

For example: The program illustrated at the top of the next page enters and stores a series of numbers. Upon depressing special function key '02, they are totaled and printed.
INPUT (Continued)

:10 DIM A(30)
:20 N = 1
:30 INPUT "AMOUNT", A(N)
:40 N = N+1 : GOTO 30
:50 DEF FN '02
:60 T = 0
:70 FOR I = 1 TO N
:80 T = T + A(I)
:90 NEXT I
:100 PRINT "TOTAL= " ; T
:110 N = I
:120 RETURN

:RUN
AMOUNT? 7
AMOUNT? 5
AMOUNT? 11
AMOUNT?
TOTAL = 23
AMOUNT?

(Depress special function key 2)
KEYIN

General Form: KEYIN alpha variable, line number, line number

Purpose

This statement checks if there is a character ready to come in from the input device buffer and, if one is ready, it reads the character into the system. For example, in the case of a keyboard, when a key is depressed, that character is stored in a buffer and the device is set to ready (i.e., a character is ready to come in). The following actions take place depending upon input conditions.

1. NOT READY - execution continues at the next statement.
2. READY WITH CHARACTER - the character is stored as the first character of the specified alphanumeric variable and execution continues at the 1st line number.
3. READY WITH SPECIAL FUNCTION KEY - the code representing the special function key (hex 00 - 1F) is stored as the 1st character of the specified alphanumeric variable and execution continues at the second line number.

The device used is that device currently selected for INPUT (Console Input device unless selected otherwise, see SELECT).

The KEYIN statement provides a convenient way to scan several input devices or to receive and edit keyed in information on a character by character basis. KEYIN may not be used in the immediate execution mode.

Example:

10 KEYIN A$, 100, 200
20 KEYIN A$(1), 100, 100
30 GOTO 20
40 KEYIN STR$(A$,1,1), 100, 200
LET

General Form:  [ LET ] variable [ , variable ... ] = expression

Purpose
The LET statement directs the system to evaluate the expression following the equal sign and to assign the result to the variable or variables specified preceding the equal sign. If more than one variable appears before the equal sign, they must be separated by commas.

The word LET is, however, optional. If it is omitted, its purpose is assumed.

An error results if a numeric value is assigned to an alphanumeric variable or if an alphanumeric value is assigned to a numeric value.

Example 1:
40 LET X(3), Z, Y=P+15/2+SIN(P-2.0)

Example 2:
50 LET J = 3

Example 3:
READY
10 X=A*E-Z*Y Here, LET is assumed.
:20 A$ = B$
:30 C$, D$(2) = “ABCDE”
NEXT

General Form: NEXT numeric scalar variable

Purpose
The NEXT statement signals the end of a loop begun by a FOR statement. The variable in the FOR statement and in its related NEXT statement must be the same.

During execution NEXT causes the index variable to be incremented. If the limit is not exceeded, transfer is made to the statement following the referenced FOR statement. If the limit is exceeded, the statement following the NEXT statement is executed.

In immediate execution mode, the NEXT statement and its corresponding FOR statement must both be in the same statement line.

Example:

```
30    FOR M=2 TO N-1 STEP 30: J(M)=I(M)+2
40    NEXT M
50    FOR X=8 TO 16 STEP 4
60    FOR A = 2 TO 6 STEP 2
65    LET B(A,X) = B(X,A)
70    NEXT A
80    NEXT X
```

Nested Loops
Section VII  General BASIC Statements

NUM

General Form: NUM (alpha variable)

**Purpose**

The NUM function determines the number of sequential ASCII characters in the specified alphanumeric variable that represents a legal BASIC number. A numeric character is defined to be one of the following: digits 0 through 9, and special characters E, ., +, -, space. Numeric characters are counted starting with the first character of the specified variable or STR function. The count is ended either by the occurrence of a non-numeric character, or when the sequence of numeric characters fails to conform to standard BASIC number format. Leading and trailing spaces are included in the count. Thus, NUM can be used to verify that an alphanumeric value is a legitimate BASIC representation of a numeric value, or to determine the length of a numeric portion of an alphanumeric value. Note: the BASIC representation of a number cannot have more than 13 mantissa digits. NUM can be used wherever numeric functions are normally used. NUM is particularly useful in applications where it is desirable to numerically validate input data under program control.

**Examples:**

```
10  A$ = "+24.37#JK"
20  X = NUM(A$)        NOTE: X = 6 since there are six numeric characters before the first non-numeric character, #.

10  A$ = "98.7+53.6"
20  X = NUM(A$)        NOTE: X = 4 since the sequence of numeric characters fails to conform to standard BASIC number format when the '+' character is encountered.

10  INPUT A$
20  IF NUM(A$)=16 THEN 50
30  PRINT "NON-NUMERIC, ENTER AGAIN"
40  GOTO 10
50  CONVERT A$ TO X
60  PRINT "X="; X
:RUN
? 123A5
NON-NUMERIC, ENTER AGAIN
? 12345
X=12345
```

**RESTRICTION:**

The NUM function cannot be used within a CONVERT statement.
ON

General Form: \[ \text{ON expression} \{ \text{GOSUB} \} \text{ GOTO } \text{ line number [,line number]} \ldots \]

Purpose
The \textit{ON} statement is a computed or conditional \textit{GOTO} or \textit{GOSUB} statement (see \textit{GOTO}, \textit{GOSUB}). Transfer is made to the \textit{lth} line specified in the list of line numbers if the truncated integer value of the expression is \textit{l}. For example, if \textit{l} = 2,

\textit{ON I GOTO 100, 200, 300}

would cause a transfer to be made to line 200 in the program. If \textit{l} is less than 1 or greater than the number of line numbers in the statement, no transfer is made; that is, the next sequential statement is executed. The \textit{ON} statement may not be used in immediate mode.

Example:
10 ON I GOTO 10, 15, 100, 900
20 ON 3*J-1 GOSUB 100, 200, 300, 400
PRINT

General Form: \[
\text{PRINT print element} \ [\ t \text{ print element} \ \ldots \ ] \ [t] \\
\text{where} \ t = \text{a comma or a semicolon} \\
\text{print element} = \text{an expression, TAB (expression), an alphanumeric} \\
\text{variable, literal string, or null.}
\]

Purpose
The PRINT statement causes the values of the listed variables, expressions, or literal strings to be printed on the output device currently selected for PRINT (see SELECT).

Printing may be done in zoned format which is signaled by a comma, or packed format, which is signaled by a semicolon separating each print element.

ZONE-FORM: \[
\text{PRINT print element} \ [, \text{print element} \ldots] \ [,]
\]

The output line is divided into as many zones of 16 characters as possible; the four CRT terminal zones are columns 0-15, 16-31, 32-47, and 48-63.

A comma signals that the next print element is to be printed starting in the next print zone, or if the final print zone is filled then the first print zone of the next line. For example

READY
:10 \text{X=214.230 :Y=3564: Z=-.2379}
:20 \text{PRINT X, Y, Z}
:RUN

214.23 3564 -.2379

PACKED FORMAT: \[
\text{PRINT print element} \ [; \text{print element} \ldots] \ ;]
\]

A semicolon signals that the next print element is to be printed immediately following the last print element, unless the last print element is an expression, in which case a space is inserted between the value of the expression and the next print element. For example, the statement

READY
:10 \text{X=2 :Y=-3.4}
:20 \text{PRINT "X":;X;"Y":;Y}
:RUN

in the following output:

\text{X = 2 \ Y = -3.4}
A PRINT statement can contain both comma and semicolon element separators. Each separator explicitly determines the amount of space between elements.

A semicolon causes 1 or no spaces to be skipped depending upon whether the previous element was an expression or text string. For example:

```
READY
:10X=2 :Y=3 :Z=-4.2
:20 PRINT "X=";X,"Y=";Y,"Z=";Z
:RUN
```

results in the following printout:

```
X =  2      Y =  3      Z = -4.2
```

The end of a PRINT line signals a new line for output, unless the last symbol is a comma or semi-colon. A comma signals that the next print element encountered in the program is to be printed in the next zone of the current line. A semicolon signals that the next print element is to be printed in the next available space, skipping 1 space if the last print element was an expression. For example, the statements

```
READY
:10 PRINT "X=";
:20 PRINT 3.2970,
:30 PRINT "Y=";64
:RUN
```

causes the following printout:

```
X =  3.297      Y =  64
```

A PRINT statement with no PRINT element advances the paper or the CRT cursor one line, or it causes the completion of a partially filled line.

Values of expressions are printed in one of two formats depending upon the value:

**FORMAT 1:**  SM.MMMMMMMMMME±XX  \(10^{-1} > \text{VALUE} \geq 10^{+1.3}\)

**FORMAT 2:**  SZZZZZZZ.ZZZZZF  \(10^{-1} \leq \text{VALUE} < 10^{+1.3}\)

where

- \(M\) = mantissa digits
- \(Z\) = integer digits
- \(X\) = exponent digits
- \(S\) = minus sign if value < 0, or blank if value \(\geq 0\).
- \(F\) = fractional digits

In format 2, the decimal point is inserted at the proper position or omitted if the value is an integer. Leading integer digit zeros and trailing fractional digit zeros are omitted.

The following are examples of the printing of variables in the two formats:

**FORMAT 1:**

```
2.34762145E-09
-1.64721000E+22
```

**FORMAT 2:**

```
23.47954890123
-.6374
0
-421
```
PRINT (Continued)

TAB (expression): This function permits the user to specify tabulated formatting. For example, TAB (17) would cause the typewriter or the CRT to move to column 17.

Positions are numbered 0 to 64 on the CRT, and 0 to 155 (Selectric). The value of the expression in the TAB function is computed, and the integer part is taken. The typewriter is then moved to this position. If it has already passed this position, the TAB is ignored. If the value of the expression is greater than maximum values, the output device moves to the beginning of the next line. Values of TAB expressions greater than 255 are illegal. For example:

```
READY
:10 FOR I=1 TO 5
:20 PRINT TAB(I);I  causes the following output:
:30 NEXT I
:RUN

1
2
3
4
5
```

In the 2200S system, a built-in carriage width of 64 characters is initially available. If more than 64 characters are printed without a carriage return, an automatic carriage return is generated. This carriage width can be changed to a value (0≤value <256) by a SELECT statement, in conjunction with selecting the device address for PRINT.
PRINTUSING

**General Form:**

```
PRINTUSING  line number [ print element  t . . . ] [ ; ]
```

- **Line number** = Line number of the corresponding IMAGE statement.
- **Expression**
- **Print element** = alphanumerical variable
  - literal string in double quotes
- **t** = comma or semicolon.

**Purpose**

The PRINTUSING statement permits numeric and alphanumerical values to be printed in a formatted fashion on the output device currently selected for PRINT (see SELECT).

PRINTUSING operates in conjunction with a referenced IMAGE statement. Print elements in the PRINTUSING statement are edited into the print line as directed by the IMAGE statement. Each print element is edited, in the order in the PRINTUSING statement, into a corresponding format in the IMAGE statement. The IMAGE statement provides both alphanumerical text to be printed between the inserted print elements, and the format specifications for the inserted print element. The format for each numerical print element is composed of # characters to specify digits and optionally +, -, ., ^, and $ characters to specify sign, decimal point, exponent and edit characters. If the number of print elements exceeds the number of formats in the IMAGE statement, a carriage return/line-feed occurs, and the IMAGE statement is reused from the beginning for the remaining print elements. The carriage return/line-feed may be suppressed by replacing the comma, delimiting the print elements with a semicolon. A carriage return/line-feed normally occurs at the end of the execution of a PRINTUSING statement. This carriage return/line-feed can also be suppressed by placing a semicolon at the end of the PRINTUSING statement. PRINTUSING may not be used in the immediate mode.

**Example 1:**

```
:10 X=2.3 : Y=27.123
:20 PRINTUSING 30, X, Y
:30 % ANGLE = #.#.## LENGTH = +##.#
:RUN

(PRINTOUT) ANGLE = 2.30 LENGTH = +27.1
```

**Example 2:**

```
:10 X=1: Y=2: Z=3
:20 PRINTUSING 30, X, Y, Z
:30 % #.#
:RUN

(PRINTOUT) 1.0
            2.0
            3.0
```
Example 3:

:10 X=1; Y=2; Z=3
:20 PRINTUSING 30, X; Y; Z
:30 % #.#
:RUN

(PRINTOUT) 1.0 2.0 3.0

Each IMAGE statement format specification has the following general format:

\[
\begin{array}{c}
+ \\
- \\
$ \\
[#, ...] [.#...]
\end{array}
\]

The IMAGE statement variable formats can be classified into three general formats:

- FORMAT 1 – Integer e.g., ###
- FORMAT 2 – Fixed Point Number e.g., ###.##
- FORMAT 3 – Exponential e.g., #.###↑↑↑

Print elements are formatted according to the following rules:

1. Numeric expression print elements:
   a) If the format specification is not started with a plus (+), minus (–), or dollar sign ($) (i.e., the first format character is a number sign (#) or decimal point (.)) and the expression is negative, a minus (–) sign is edited into the print line and the length of the format increased by one.
   b) If the format specification is started with a plus (+) sign, the sign of the expression (+ or –) is edited into the print line immediately preceding the first significant digit.
   c) If the format specification is started with a minus (–) sign, a blank for positive expressions and a minus (–) sign for negative expressions is edited into the print line immediately preceding the first significant digit.
   d) If the format specification is started with a dollar ($) sign, a dollar ($) sign is edited into the print line immediately preceding the first significant digit.
   e) Commas (,) in the integer portion of the format are edited into the print line as they occur, if a significant digit has been edited prior to their occurrence; otherwise a blank is inserted.
   f) If the length of the value to be printed is less than the length of the format specification (overformatted) the value is right adjusted. If the length of the value to be printed is greater than the length of the format specification (underformatted) the format specification is edited into the print line (i.e., #’s are printed instead of a number).
PRINTUSING (Continued)

g) The expression value is edited according to the format specified in the image statement.

FORMAT 1 — The integer part of the value is printed truncating any fractions. Leading blanks are inserted.

FORMAT 2 — The value is printed as a fixed point number, truncating or extending any fraction with zeros and inserting leading blanks according to the format specification.

FORMAT 3 — The value of the expression is printed as a floating point number. The value is scaled as specified by the format and printed as in formats 1 or 2. (There are, however, no leading blanks.) The exponent is always printed in the 4 character form: E±XX.

2. Alphanumeric string variables or literal string print elements:

The value of a string variable or a literal string in quotation marks is edited into the print line by replacing each character in the format specification with characters in the text string. The text string is left-justified. if the text string is shorter than the format specifications, blanks are inserted on the right. The text string is truncated on the right if it is longer than the format specifications.

Example 1:

:100 PRINTUSING 200, 1242.3, 73694.23
:200 %TOTAL SALES = #### VALUE $#####.####
:RUN

(PRINTOUT) TOTAL SALES = 1242 VALUE $73,694.23

Example 2:

:100 PRINTUSING 200, 2.13E-5, 2.3E-9
:200 % COEFF = +##### E=#### ERROR = -#####
:RUN

(PRINTOUT) COEFF = +.213E-04 ERROR = 23E-10

Example 3:

:100 PRINTUSING 200, 317.23
:200 % +#.###
:RUN

(PRINTOUT) +###.### (Value too large for format)

Example 4:

:100 PRINTUSING 200
:200 % PROFIT AND LOSS STATEMENT
:RUN

(PRINTOUT) PROFIT AND LOSS STATEMENT
Example 5:

100 PRINTUS/NG 200, A$, T
200 % SALESMA/3 #/###### TOTAL SALES $##.####.##
RUN

(PRINTOUT) SALESMA/N J. SMITH TOTAL SALES $9,237.51
### READ

**General Form:**

```plaintext
READ variable [ ,variable ...] 
```

**Purpose**

A READ statement causes the next available elements in a DATA list (values listed in DATA statements in the program) to be assigned sequentially to the variables in the READ list. This process continues until all variables in the READ list have received values or until the elements in the DATA list have been used up. The variable list can include both numeric and alphanumerical variable names. However, each variable must reference the corresponding type of data or an error will result.

The READ statements and DATA statements must be used together. If a READ statement is referenced beyond the limit of values in a DATA statement, the system looks for another DATA statement in statement number sequence. If there are no more DATA statements in the program, an error message is written and the program is terminated. DATA statements may not be used in the immediate mode.

The RESTORE statement can be used to reset the DATA list pointer, thus allowing values in a DATA list to be re-used (see RESTORE).

---

**NOTE:**

*DATA statements may be entered any place in the program as long as they provide values in the correct order for the READ statements.*

---

**Example:**

```plaintext
:100 READ A, B, C
:200 DATA 4, 315, -3.98

:100 READ A$, N, B1$ (3)
:200 DATA "ABCDE", 27, "XYZ"

:100 FOR I = 1 TO 10
:110 READ A(I)
:120 NEXT I

.....

200 DATA 7.2, 4.5, 6.921, 8, 4
210 DATA 11.2, 9.1, 6.4, 8.52, 27
```
REM

**General Form:**

REM text string
where text string = any characters or blanks (except colons; colons indicate the end of the statement)

**Purpose**

The REM statement is used at the discretion of the programmer to insert comments or explanatory remarks in his program. When the system encounters a REM statement, it ignores the remainder of the line.

*Examples:*

20 REM SUBROUTINE
210 REM FACTOR
220 REM THE NUMBER MUST BE LESS THAN 1
RESTORE

General Form: \[ \text{RESTORE} \{ \text{expression} \} \]
where \(1 \leq \text{value of expression} < 256\)

Purpose

The \texttt{RESTORE} statement allows the repetitive use of DATA statement values by READ statements. When \texttt{RESTORE} is encountered, the system returns to the \(n\)th DATA value, where \(n\) is the truncated value of the expression if one is included in the \texttt{RESTORE} statement; otherwise, it is assumed to be the first DATA statement. Then, when a subsequent READ statement occurs, the data is read and used, beginning with the \(n\)th DATA element.

\[\text{Example:}\]
\[100 \text{ RESTORE}\]

This statement causes the next READ statement to begin with the first data element.

The statement \[100 \text{ RESTORE 11}\]
causes the next READ statement to begin with the 11th data element.

The statement \[100 \text{ RESTORE } X^{12}+7\]
causes the expression \(X^{12}+7\) to be evaluated and truncated to an integer. The next READ statement begins with the corresponding data element.
RETURN

General Form: RETURN

Purpose

The RETURN statement is used in a subroutine to return processing of the program to the statement following the last executed GOSUB or GOSUB’ statement.

If entry was made to a marked subroutine via a special function key on the keyboard, the RETURN statement terminates program execution and returns control back to the keyboard, or to an interrupted INPUT statement.

Repetative entries to subroutines without executing a RETURN should not be done. Failure to return from these entries causes return information to be accumulated in a table which could eventually cause the table overflow error (ERROR 02).

Example:

10 GOSUB 30
20 PRINT X :STOP
30 REM THIS IS A SUBROUTINE
40 -
50 -
- -
- -
90 RETURN :REM END OF SUBROUTINE

10 GOSUB’ 03 (A,B$)
20 END
100 DEFFN’ 03 (X,N$)
110 PRINTUSING 111, X, N$
111 % COST = $#,###,#### CODE = ####
120 RETURN
RETURN CLEAR

General Form: RETURN CLEAR

Purpose:

To clear subroutine return address information from the last executed subroutine call.

The RETURN CLEAR statement is a dummy RETURN statement. With the RETURN CLEAR statement subroutine return address information from the last previously executed subroutine call is removed from the internal stacks, but the branch to the statement following the last executed GOSUB, GOSUB' or keyboard (if a special function key was depressed) is not performed. Execution continues at the next statement following RETURN CLEAR.

The RETURN CLEAR statement is used to exit a program from a subroutine without returning. This is particularly useful when using the special function keys to start program execution at a desired point when either in Console Input mode or when the system is waiting for keyboard entries when an INPUT statement is executed. When a keyboard special function key is used in this manner, a subroutine branch is made to the appropriate DEFFN' statement to begin execution.

A subsequently executed RETURN statement either causes the system to return to the Console Input mode or causes the INPUT statement to be repeated automatically. However, the user may wish to start and continue a program without returning when a special function key is depressed, in which case, the RETURN CLEAR statement would be used to exit from the DEFFN' subroutine (e.g. multi-entry points to a program).

Examples:

100 DEFFN' 15: RETURN CLEAR
200 RETURN CLEAR

NOTES:

If a program repeatedly exits from a subroutine without executing a RETURN or RETURN CLEAR statement, error 02 results.

When a program is loaded into memory it must be initially executed by a RUN command; thereafter, it can be restarted at any point via special function keys.
STOP

| General Form: | STOP ["character string"] |

**Purpose**

The STOP statement terminates program execution. A program can have several STOP statements in it. When a STOP statement is encountered, the system types STOP followed by the specified character string if one is entered.

To continue program execution at the statement immediately following the STOP statement, a CONTINUE command must be entered.

*Example:*

```
100 STOP
100 STOP "MOUNT DATA CASSETTE"
```
Section VII General BASIC Statements

TRACE

General Form: TRAC[OFF]

Purpose
The TRACE statement provides for the tracing of the execution of a BASIC program. TRACE mode is
turned on in a program when a TRACE statement is executed and turned off when a TRACE OFF state-
ment is executed. TRACE also is turned off when a CLEAR command is entered, the system is RESET, or
the system is turned on. To trace an entire program, TRACE may be turned on by entering a TRACE
immediate mode statement prior to execution, and similarly turned off by entering an immediate mode
TRACE OFF after execution. When the TRACE mode is on, printouts are produced when:

1. Any program variable receives a new value during execution (LET, READ, FOR statements, etc.).
   Printout format: variable = received value

2. A program transfer is made to another sequence of statements (GOTO, GOSUB, IF, NEXT).
   Printout format: TRANSFER TO 'line number'

Example 1:
30 LET X, Y, Z (5) = A + SIN(B)/C
   the TRACE printout:
   X =
   Y =
   Z ( ) = 29.631

Example 2:
:40 READ A, B, C(22), D
   produces
   A = 9.4
   B = 64.27
   C ( ) = 1.37492100E+11
   D = 99.4

Example 3:
:100 GOTO 200
   produces
   TRANSFER TO 200

Example 4:
30 GOSUB 10
   produces
   TRANSFER TO 10
Example 5:
:10 FOR I=1
:15 PRINT X(I);
:20 NEXT I

produces
I=1
I=2
TRANSFER TO 15
I=3
TRANSFER TO 15
I=> (end-of-loop indicator)

Example 6:

:10 A$=HEX(414243)

produces
A$=HEX(414243)

Example 7:

:10 STR(A$,I,4)= "ABCD"

produces
STR(
A$=ABCD

Example 8:
10 AND (A$, 00)

produces
A$=HEX (0000000000000000000000000000000000000000000000000000000000000000)

Example 9:

:100 FOR I = 1 TO 4
:110 TRACE
:120 X = X+A(I)
:130 TRACE OFF
:140 NEXT I
RUN

produces
X = 24.2
X = 49.56
X = 97.561
X = 112.32
VAL

General Form:

VAL \{ \langle \text{alpha variable} \rangle \}

\{ \langle \text{literal string} \rangle \}

Purpose

This function converts the binary value of the first character of the specified alphanumeric value to a floating point number. VAL can be used wherever numeric functions normally are used.

VAL is particularly useful for code conversion and table lookups, since the converted number can be used either as a subscript to retrieve an equivalent code or data from an array, or with the RESTORE statement to retrieve codes or information from DATA statements.

Examples:

10 \hspace{1em} X = \text{VAL}(A$)
20 \hspace{1em} \text{PRINT} \ \text{VAL}("A")
30 \hspace{1em} \text{IF} \ \text{VAL(STR(A$, 3, 1)}) < 80 \ \text{THEN} \ 100
40 \hspace{1em} \text{Z} = \text{VAL}(A$) \times 10 - Y

101
Section VIII

Tape Cassettes
Section VIII Tape Cassettes

Single Tape Cassettes

The 2217 Single Tape Cassette Recorder and the 2220 Integrated Single Tape Cassette Recorder are contained within the housing of the Model 2216 CRT and the Model 2220 Integrated console, respectively. They are located in the right hand corner of these housings and connect to the CPU with a connector cord (at back of the CRT housing). A separate cord is provided with the 2217 which goes to any wall outlet.

MOUNTING AND REMOVING A TAPE CASSETTE

The tape drive is opened by pressing the white push button to the right of the tape. A cassette is loaded into the tape drive with the label facing you.

Once the cassette is in place, the door should be closed.

Before using a tape, it should be rewound. This can be done in two ways: 1) touching the REWIND button on the CRT housing, or 2) keying REWIND CR/LF EXECUTE (or RETURN(EXEC)) from the 2220, 2215 or 2222 keyboard.

For example, key

\[ \text{SHIFT} \quad \text{LOCK} \quad \text{REWIND} \quad \text{SHIFT} \quad \text{CR/LF EXECUTE} \]

The second method enables you to rewind a tape under program control.

A tape is removed from the tape drive by opening the tape drive door. Should this door not open, it is due to a double lock activated to prevent a tape from being removed which is not completely rewound.

Whenever the tape drive is in motion the yellow operating light next to the drive is on. Do not try to remove a tape when this light is on.
MAGNETIC TAPE HEAD CLEANING

The magnetic tape cassette requires much the same care as required for cassettes used with home cassette recorders. The cassettes should be kept as free as possible from dust and dirt, and the magnetic heads should be periodically cleaned. The cleaning process is as follows:

The tape reading head is located in the top center of the magnetic tape unit (Figure 1). The head can be lowered to the cleaning position as follows: select the tape unit by keying LOAD, CR/LF. The head will be lowered into the position as shown in Figure 2 (disregard \textup{ERR 49 on CRT}).

![Figure 1](image1)
![Figure 2](image2)

Tear open the foil packet containing the cleaning pad and rub the magnetic tape head gently for a few moments (Figure 3). After cleaning, dispose of the pad in the foil packet, exercising care that it does not touch any painted, shellacked, or plastic surface.

The 2200S can be restored to service by depressing the rewind button. The rewind process restores each head to its normal position (Figure 4).

![Figure 3](image3)
![Figure 4](image4)

The cleaning operation should be performed every three weeks under normal conditions. In the event that your tapes have become heavily contaminated with dust or dirt, or if the 2200S is operating with the room humidity below 20\%, then more frequent cleaning is required because of possible electrostatic attraction of dust and dirt to the tape mechanism.

Cleaning pads can be obtained from your Wang Serviceman.

PROTECTING A PROGRAM ON TAPE

With the System 2200S a new program simply writes over an old program; there is no need to erase the tape. To insure that a good program stored on tape is not written over or lost accidentally, the tape can be protected.

To protect a program on tape, flip the orange plastic tab on the bottom right of the tape cassette 180\°. When the tab is flipped over, an opening in the tape cassette indicates that the tape is protected.

If you need to write over the data (unprotect the tape) at a later date, flip the orange tab back 180\° to cover the opening in the tape cassette.
Section VIII Tape Cassettes

TAPE FORMAT

The 2200S provides the capability to record both programs and data onto cassette tape. Both programs and data are recorded on tape in 256 byte physical records. A 2200S user, however, need not worry about formatting a tape since the 2200S does this automatically. For example, if you wish to save a program currently in memory on cassette tape, key:

SAVE RETURN(EXEC)

The program is automatically recorded onto cassette tape; as many 256 byte physical records as are necessary are written.

To read back the program, rewind the tape and key:

CLEAR RETURN (EXEC) (Clears 2200S memory.)
LOAD RETURN (EXEC) (Loads the program from cassette.)

To insure data exactness, each physical record is recorded twice on tape. Dual recording and read-back is done automatically by the system, and requires no special user considerations.

PROGRAM FILES

When programs are recorded on cassette tape, it is not sufficient to merely record the program lines. It is important for the 2200S system to tell where the beginning and ending records of a program are. Therefore, every time a program is recorded, the 2200S system automatically records a header record before the program, and a trailer record after the program. Each recorded program thus becomes a program file. The figure below illustrates a program file.

| HEADER RECORD | 1st PROGRAM RECORD | 2nd PROGRAM RECORD | ...... | Nth PROGRAM RECORD | TRAILER RECORD |

Header Record

This is a physical record (256 bytes) which contains a control byte identifying it as a header (or beginning record) of a program. It also contains 8 bytes which can be used to store the name of the program, if the program is named when saved. The remainder of the record is blank. Thus, on a tape containing a number of programs, a particular program can be searched for by name. For example, a program is saved and named as follows,

SAVE "EVAL1"

Program Record

Each program record is a 256 byte physical record containing a portion of the saved program. It also contains a control byte identifying it as a physical record which contains part of a program (i.e., a program record).

Trailer Record

The trailer record is similar to a program record except that the trailer record has a control byte identifying it as the final physical record of the current program file (i.e., the trailer record).

There are a number of advantages associated with having program files.
Section VIII Tape Cassettes

Programs can be automatically searched and loaded by reference to the name of the program:

LOAD "EVAL1"

Program files can also be skipped and backspaced over by simple commands:

SKIP 2F (skip forward over 2 files)
BACKSPACE 3F (backspace over 3 files)

For example, if a user wants to add a 4th program to a cassette tape that already has three, he follows this sequence:

1. Mount the tape in the drive.
2. Depress the manual rewind button, or enter "REWIND".
3. Key SKIP 3F (skip the 3 current program files).
4. Key SAVE "PROG4" (save the program in memory on tape and name it "PROG4").
5. Rewind and remove the tape.

RECORDING DATA ON TAPE
Data is recorded onto a cassette tape by means of a DATASAVE statement. For example, the following statement in a program would record the values of the variables A, B, C$ and the 3rd element of 1-dimensional array D:

100 DATASAVE A, B, C$, D(3)

In addition, the 2200S offers the ability to record and read entire arrays by simply listing the array name followed by a left and right parenthesis, (). For example, values of all elements of the arrays A, B, and C$ can be written by:

10 DIM A(40), B(10,10), C$(10)
....
....
100 DATASAVE A(), B(), C$( )

READING DATA FROM TAPE
Data is read back from tape using a DATALOAD statement. For example:

100 DATALOAD A, B, C$, D(3)
200 DATALOAD A(), B(), C$( )

With the DATALOAD statement, the tape is read and the read values are sequentially assigned to the scalar and array variables listed in the program.

LOGICAL DATA RECORDS
Since all programs and data are recorded on cassette in 256 byte physical records, it is possible for the values of the variable list of a DATASAVE statement to exceed 256 bytes. In this case, two or more physical records are written. The one or more physical records written by the execution of one DATASAVE statement is called a LOGICAL RECORD. When data is read back by a DATALOAD statement, the entire
Section VIII Tape Cassettes

Logical record is read, reading physical records sequentially one at a time. If there are more values on a logical record than are called for in a variable list of a DATALOAD statement, the unused values are bypassed, and the tape is positioned at the beginning of the next logical record. For example, 50 logical records consisting of the current values of the arrays A and B could be written with the following program sequence:

```
READY
:90  FOR I = 1 TO 50
:100  DATASAVE A( ), B( )
:
:200  NEXT I
:
```

The logical records can be read back after rewinding the tape, with only the array A specified. In the following example,

```
READY
:400  REWIND
:410  FOR I = 1 TO 50
:420  DATALOAD A( )
:
:500  NEXT I
:
```

the values of array B on each logical record are bypassed when read.

If more data is required in a variable list of a DATALOAD statement than is found in a logical record, another logical record is read to complete the list. For example, the arrays A and B can be written on separate logical records:

```
100  DATASAVE A( )
110  DATASAVE B( )
```

and both logical records can be read back in one DATALOAD statement:

```
200  REWIND
210  DATALOAD A( ), B( )
```

It is generally better, however, to read back data with a variable list identical in format to the DATASAVE statement which wrote that data.

Logical data records can be skipped and backspaced over. For example,

```
100 SKIP 3               Skip forward over 3 logical records
110 BACKSPACE 2*N       Backspace over 2*N logical records
```

DATA FILES

A series of logical data records on cassette can be made into a data file, similar to a program file, by preceding the records with a header record and following the records with a trailer record. Unlike program files however, the header and trailer record are not automatically generated by the 2200S system. They must be generated by the user's program using special forms of the DATASAVE statement.

```
DATASAVE OPEN "FILE1"         (Write a data file header record on tape
                              and name the file "FILE1"; data files
                              must be named.)

DATASAVE END                  (Write a data file trailer record on tape.)
```

107
Section VIII Tape Cassettes

Therefore, a data file constructed by a series of DATASAVE statements would be as follows:

```
HEADER RECORD  1st DATA RECORD  2nd DATA RECORD  3rd DATA RECORD  1st DATA RECORD  2nd DATA RECORD
1st LOGICAL RECORD

1st DATA RECORD  2nd DATA RECORD  TRAILER RECORD
Nth LOGICAL RECORD
```

The header, data records, and trailer record are similar to those in a program file except that the control information in the records identifies them as data file records.

Therefore, a typical sequence for creating a data file could be:

```
:100  DATASAVE OPEN "STATFILE"     (Write header record.)
     .
     .
:150  FOR I = 1 TO N
:160  DATASAVE A, B, C$, D( )      (Write data records.)
     .
     .
:220  NEXT I
     .
:300  DATASAVE END                  (Write a trailer record)
```

Formatting a series of logical records into data files offers the same flexibility as program files. Data files can be searched on a tape by name using a special form of the DATALOAD statement. For example:

```
:100  DATALOAD "SAM"
```

This statement causes the system to search forward on the cassette tape until a data header record with the name "SAM" is found, and leaves the tape positioned to read the first logical record. If the data file to be searched could be either prior to or after the current tape position, a high speed rewind statement can be executed prior to the search:

```
:100  REWIND
:110  DATALOAD "FILES"
```

Data files and program files can be recorded together on the same tape. The file SKIP and BACKSPACE statements apply to either kind of file. For example:

```
:100  SKIP 3F     (SKIP over the next 3 data or program files.)
:200  BACKSPACE 2F (BACKSPACE over the last two program or data files.)
```
Section VIII Tape Cassettes

When logical data records are organized as files, record skipping and backspacing have additional features. For example:

:300 SKIP END (SKIP to end of file.)
:400 BACKSPACE BEG (BACKSPACE to beginning of file.)

In addition, because header and trailer records are present, the system prevents skipping over the beginning or end of file when skipping or backspacing logical records. (If more records are specified to be skipped or backspaced than exist in the remainder of the file, the tape stops at the trailer or header record.)

A final, and very important feature of data files is the ability to test for the end of file. In many cases when a data file is read, it is not always known how many records a file contains. When the trailer record is encountered while reading data records, an end of file condition is set and it can be tested by an IF END statement.

:200 DATALOAD A, B, C(10,2), D( )
:210 IF END THEN 300

In the above example, a transfer is made to statement 300 when a trailer record is read. The tape is repositioned back to the beginning of the trailer record. The end of file condition remains set until a subsequent DATALOAD statement is executed.

REWITING DATA RECORDS

The 2200S provides a special capability to rewrite individual logical data records within a file. The 2200S system records timing bits in front of all records to insure proper alignment of a record before it is written. A special statement, DATARESAVE, is used to rewrite records. For example, a typical program sequence for rewriting a record might be:

:100 DATALOAD "COSTFILE" (Search to beginning of file.)
:150 DATALOAD A, B, C( ), D$( ) (Read next record.)
:160 IF A = X THEN 200 (Test if record to be rewritten.)
:200 B = C:C(1) = D (Modify record.)
:210 BACKSPACE 1 (Reposition before record.)
:220 DATARESAVE A, B, C( ), D$( ) (Rewrite record.)

NOTE:
The tape must be positioned directly in front of the old record to be rewritten. It is also important, when a record is rewritten, that the argument list be identical in format to that of the old record (i.e., the same number and type of variables, in the same order). Although the main requirement is that the rewritten logical record produces the same number of physical records as the old one did, miscalculations and tape formatting errors can be avoided if the argument lists are identical in format. Under no circumstances should records be rewritten using just the DATASAVE statement. Tape errors will result.
Section VIII Tape Cassettes

SPACE REQUIREMENTS ON CASSETTE

Numeric and alphanumeric data are stored on a cassette in the following format. Each numeric value occupies 9 bytes in the record. Literal string values occupy the length of the string plus 1 byte. Each alphanumeric variable value occupies either the default length (16 bytes) plus 1 additional byte, or the dimensioned length of the variable plus 1 byte. In each physical record a total of 253 bytes is available for storing data and the necessary control bytes for each variable or array. Partial values are not written in a physical block; if a value of a scalar variable or array element to be recorded does not fit into the current physical block, the value is recorded in the next physical block.

DEVICE ADDRESS SPECIFICATIONS

Up to this point, examples have been presented for recording and reading of cassette tapes without a specification of a device address. Since 2200S systems can be purchased with a number of cassette drives, the user may specify what drive he wishes. The following rules apply to device address selection.

1. If no address is specified with Input/Output statements (i.e., LOAD, SAVE, DATALOAD, DATASAVE, SKIP, etc.), the system assumes a cassette tape is implied, and uses the default type address. Therefore, a System 2200S with just one cassette does not require a cassette device address to be specified.

2. The tape default address is set to 10A when the system is master initialized (power is turned ON). It may, however, be changed by the SELECT statement. For example:

:SELECT TAPE 10B

would change the default tape address to 10B. It then remains set to 10B until the system is master initialized (power turned OFF, then ON), or when the address is changed by another SELECT statement.

3. There are two ways of specifying an I/O device address within an I/O statement: (These apply to other devices as well as cassettes.)
   a. Absolute Device Specification
      A three character device address, preceded by a slash (/) character, can be entered in the statement after the statement verb and is followed by a comma(.)

      Example:
      
      :LOAD/10B, “LINPROG”
      :100 DATASAVE/10C, A(), B() 
      :110 SKIP/10D, 2F

   b. Indirect Device Address Specification (File Numbers)
      Six storage locations are available in the 2200S system for the assignment of device addresses. They are called file numbers and are referenced as follows: #1, #2, #3, #4, #5, #6.
      File numbers are assigned addresses in a SELECT statement. For example, the following statement

      :100 SELECT #1, 10B, #2 10C

      assigns the device address 10B to #1 and 10C to #2. Thereafter the file number can be used in the I/O statements:

      :LOAD #1 
      :DATASAVE #2, A, B, C$ 
      :BACKSPACE #2, 1

      The device address assigned to the specified file number is used in the I/O statements. File numbers for cassette operations allow the user to reassign cassette drives for all the I/O operations in a program by changing just the SELECT statement.

4. The legal cassette addresses are 10A, 10B, 10C, 10D, 10E and 10F. The cassette drive addresses are marked next to the 2217 and 2220 cassette drive controller plugs on the CPU chassis.
General Form:

```
BACKSPACE [#n, [BEG]
/xxx, [nF]
```

Where #n = File number to which the device address has been assigned.
(#n = #1, #2, #3, #4, #5, or #6)

xxx = Device address of cassette

If neither of the above is specified, the default device address (the device address currently assigned to TAPE [see SELECT]) is used.

BEG = Backspace to beginning of file. (After header record.)
n = Backspace n logical records
nF = Backspace n files (Note, if n=1 backspace to beginning of current file before header record.)
n = Expression (the integer portion of the value of the expression is used and must always be ≥ 1)

Purpose

The BACKSPACE statement allows the user to reposition the indicated cassette tape backwards to the start of any program or data file, or backward a specified number of logical records within a data file. The 'BEG' parameter positions the tape at the beginning of the current file immediately after the header record. The 'n' parameter is for data files only; it allows the user to backspace the tape over n logical records to the start of any desired logical record. The 'nF' parameter backspaces the tape n files; the tape is positioned before the header record.

Example:

```
100 BACKSPACE /10A, BEG
220 BACKSPACE #2, 4F
150 BACKSPACE (5-3*X)
```
DATALOAD

General Form:

```
DATALOAD [ #n, /xxx , ] {"name" } { argument list }
```

- `#n` = File number to which device is currently assigned (n is an integer from 1-6)
- `xxx` = Device address of device to load from.

If neither of the above is specified the default device address (the device address currently assigned to TAPE (see SELECT) ) is used.

- "name" = The name of the data file to be searched.
- "name" is from 1 to 8 characters.

```
argument list = { numeric variable
               { alphanumeric variable
               { numeric variable
               { alpha or numeric array designator
               , , ...
               array designator = array name ( ) e.g., A( ), B( ), C2( ), A$()
```

Purpose

The DATALOAD statement reads a logical record from the designated tape and assigns the data values read to the variables and/or arrays in the argument list, sequentially. Arrays are filled row by row. If the variable list is not complete, another logical record is read. Data in the logical record, not used by the DATALOAD statement, is ignored. If the end of file (trailer record) is encountered while executing a DATALOAD statement, the tape remains positioned at the end of file trailer record and the values of remaining variables in the argument list remain at their current values. An IF END THEN statement then causes a valid transfer.

The "name" parameter permits a data file to be searched out. Upon execution of a DATALOAD "name" statement, the tape is positioned just after the header record of the specified file.

Example:

```
DATALOAD "PROGRAM1"
DATALOAD A, B, C(10)
DATALOAD #1, A, B( ), C$
DATALOAD /10B, A, B, X1, STR(A$, 3, 5)
```

112
General Form:

\[
\text{DATARESAVE} \left[ \begin{array}{c}
\text{#n,} \\
\text{/xxx,}
\end{array} \right] \left\{ \begin{array}{c}
\text{OPEN "name"}
\end{array} \right\} \left\{ \begin{array}{c}
\text{argument list}
\end{array} \right\}
\]

where

- \( \text{#n} \) = File number to which the device is currently assigned. (\( n \) is an integer from 1 to 6)
- \( \text{xxx} \) = Device address of device to save on.

If neither of the above is specified, the default device address (the device address currently assigned to TAPE (see SELECT)) will be used.

\( \text{OPEN} \) = Rewrite a data file header record with the name "name". Name is from 1 to 8 characters.

\[ \text{argument list} = \begin{cases} 
\text{literal string} \\
\text{alphanumeric variable} \\
\text{expression} \\
\text{array designator}
\end{cases}, \ldots \]

\[ \text{array designator} = \text{array name( ) e.g., A$( ), B( ), C2( ), D$( )} \]

Purpose

The DATARESAVE statement allows the user to rewrite (i.e. update) any complete logical record including the header record, of an existing data file. Rewriting the header record permits the user to rename a file.

REWITING A DATA RECORD

Rewriting (updating) a logical data record within a file generally involves 3 steps:

1. Locating the beginning of the file with a DATALOAD "name" statement (see DATALOAD).
2. Locating the particular logical record to be updated using the DATALOAD, SKIP or BACKSPACE statements.
3. Re-recording the logical record using the DATARESAVE statement.

When executing the DATARESAVE statement, the tape must be positioned just before the record to be updated. The DATARESAVE statement must be used for updating; if an update is performed using a DATASAVE statement, there is no assurance that the new record will be written in the proper place -- extraneous information may be left over from the old record. The user must be sure that the number of physical records in the logical record created by the DATARESAVE statement is the same as the number of physical records in the logical record being updated. This situation is assured if the 'argument list' in the DATARESAVE statement is identical to the 'argument list' in the original DATASAVE statement.

CAUTION

- DATARESAVE -

System design using this command is not recommended. Use of this command should be made sparingly since varying environmental and electrical power conditions affect inserting a new block of data in previously recorded material.
Example:

```
DATARESAVE /10B, A, B$, C
DATARESAVE #1, OPEN "DATAFILE"
DATARESAVE A$( )
DATARESAVE STR(A$, 5, 1), HEX (010203), "WANG LABS."
DATARESAVE R*SIN(X)
```
DATASAVE

General Form:

```
DATASAVE [ #n, /xxx, ] { OPEN "name" } { END argument list } 
```

where

- **#n** = File number to which the device is currently assigned. (n is an integer from 1 to 6)
- **xxx** = Device Address of cassette on which data is written.

If neither of the above is used, the default device address (the device address currently assigned to TAPE [see SELECT]) will be used.

- **OPEN** = Write a Data file header record with the name "name". The name is from 1 to 8 characters.
- **END** = Write a Data file trailer record

```
argument list = { literal string 
                  alphanumeric variable 
                  expression 
                  array designator 
                 }, ... 
```

array designator = array name( ) e.g., A( ), B( ), C2( )

**Purpose**

The DATASAVE statement causes the values of variables, expressions, and array elements to be written sequentially onto the specified tape. Arrays are written row by row. Each DATASAVE statement produces one logical record. Each numeric value occupies 9 characters in a record; each literal occupies the number of characters in the value +1; each value of an alpha variable string occupies the maximum defined length of the variable +1.

The OPEN and END parameters are used to write header and trailer records at the beginning and end of a data file. However, data files can be created without the need for header and trailer records. If a single data file is to be written on a cassette, it can be done simply by using one or more DATASAVE statements with argument lists. The data in the file can be retrieved using DATALOAD statements with argument lists. If more than one data file is to be written on a cassette, it is common practice to place a header record at the start of each file and a trailer record at the end of each file. In this way the user can search out any file by using the assigned 'name' in the header record (see DATALOAD) and can test for the end of a file using the trailer record (see IF END THEN). The header and trailer records can also be used in backspacing over and skipping records and files (see BACKSPACE, SKIP).

**Example:**

```
DATASAVE A, B, C, D(4,2)
DATASAVE #2, A, B, C( )
DATASAVE /10A, A$, B, C, D( )
DATASAVE OPEN "PROGRAM 1"
DATASAVE #5, END
DATASAVE STR(A$,3,5), HEX(0102), "WANG LABS."
DATASAVE Y*SIN(R)
```
## LOAD

### CASSETTE COMMAND

**General Form:**

```
LOAD [ #n, 
      /xxx, ] ["name"]
```

- `#n` = File number to which a device address is currently assigned. 
  
  `(n = an integer from 1 to 6)`

- `xxx` = Device address of device to load from.
  
  `If neither of the above is specified, the default device address (the device address currently assigned to TAPE, see SELECT) is used.`

- `"name"` = Is the name assigned to the program on tape. "name" is from 
  one to eight characters.

### Purpose

When the LOAD command is entered, the specified program on the selected tape is appended to 
the current program in memory. If no program name is specified, the next program file on the selected 
tape is loaded. This command permits an additional program to be loaded and appended to a program 
currently in the 2200S, or if entered after a CLEAR command, the entry of a new program.

LOAD can also be used as a program statement; this is described on the next page.

### Example:

```
LOAD
LOAD "LINREGR"
LOAD#1, "PROGRAM1"
LOAD/10B
LOAD#4
```
LOAD

General Form:

\[
\text{LOAD} \left[ \#n, \quad \text{name} \right] \quad [\text{line number 1}] \quad [\text{line number 2}]
\]

where \( \#n \) = file number to which the device is currently assigned. 
\( n \) is an integer from 1 to 6.

\( \text{xxx} \) = device address of cassette.

If neither of the above is specified, the default device address (the device address currently assigned to TAPE (see SELECT)) is used.

\text{"name"} = is the name of the program to be searched and loaded; it is from 1 to 8 characters. Searching is always forward. 
(If a program is stored prior to current tape position, the user should give a REWIND command first.)

\text{line number 1} = \text{The line number of the first line to be deleted from a currently loaded program prior to loading the new program. After loading, execution continues at the line whose number is equal to line number 1. An error will result if there is no line number = \text{line number 1}' in the new program.}

\text{line number 2} = \text{The line number of the last line to be deleted from the program currently in memory, before loading the new program.}

Purpose

This is a BASIC program statement which in effect produces an automatic combination of the following:

\begin{align*}
\text{STOP} & \quad \text{(stop current program execution)} \\
\text{CLEAR P} & \quad [\text{line number 1}] \quad [\text{line number 2}] \quad \text{(delete current program text)} \\
\text{CLEAR N} & \quad \text{(remove noncommon variables only)} \\
\text{LOAD} & \quad [\text{"name"}] \quad \text{(load new program)} \\
\text{RUN} & \quad [\text{line number 1}] \quad \text{(run new program)}
\end{align*}

If only 'line number 1' is specified, the remainder of the current program is deleted starting with that line number. If \text{LOAD} is a program statement in the current program and no line numbers are specified the entire current program is deleted and the newly loaded program is executed from the lowest line number.

This permits segmented jobs to be run automatically without normal user intervention. Common variables are passed between program segments. \text{LOAD} must be the last statement on a statement line. The \text{LOAD} statement must not be within a FOR/NEXT Loop or subroutine; an error results when the NEXT or RETURN statement is encountered.

In the immediate execution mode, \text{LOAD} is interpreted as a command (see \text{LOAD} command).

Example:

\begin{align*}
100 & \text{LOAD} \quad 100 & \text{LOAD /10A} \\
100 & \text{LOAD } \#2 \quad 100 & \text{LOAD /10B, "PROG#7", 500} \\
100 & \text{LOAD \text{"SAM"}} \quad 100 & \text{LOAD } \#2, \text{"SAM" } 400, 1000
\end{align*}
REWIND

General Form:

\[
\text{REWIND} \quad \left[ \begin{array}{c} \#n \\ /xxx \end{array} \right]
\]

where \( \#n \) = logical file number to which a device address has been assigned (n is integer from 1 to 6).

\( xxx \) = device address of cassette

If neither of the above is specified, the default device address (the device address currently assigned to TAPE (see SELECT)) is used.

Purpose

The REWIND statement causes the indicated cassette to be rewound.

Example:

\[
\begin{align*}
\text{REWIND} \\
100 \text{ SELECT } \#2 \text{ 10B} \\
110 \text{ REWIND } \#2 \\
30 \text{ REWIND} \\
40 \text{ REWIND } /10C
\end{align*}
\]
## SAVE

**General Form:**

```
SAVE [\#n, ] [P] ["name"] [line number [line number]]
```

where

- \#n = File number to which device address is assigned (#1 → #6).
- xxx = Device address of desired output tape.

If neither of the above is specified, the default device address (the device address currently assigned to TAPE, see SELECT) is used.

- P = Sets the protection bit on the program file to be saved.

- "name" = Is the name assigned to the program on tape. "name" is from one to eight characters.

1st 'line number' = Starting line number to be saved.

2nd 'line number' = Ending line number to be saved.

### Purpose

The SAVE command causes BASIC programs (or portions of BASIC programs) to be written onto the selected tape. The program may be named by using the "name" parameter so the user can address this program file in subsequent LOAD commands.

If no line numbers are specified, the entire user program text is written onto the specified tape. SAVE with one line number causes all user program lines from the indicated line through the highest numbered program line to be written onto tape. If two line numbers are entered, all text from the first through the second line number, inclusive, is written.

The 'P' parameter permits the user to protect saved programs. That is, if a program that has been saved by a SAVE P command is loaded, it may not be listed or saved again. Note, in order to list or save ANY program after a protected program has been loaded, the user must enter a CLEAR command (with no parameters) or MASTER INITIALIZE the system, (i.e., turn power off and then on).

SAVE is a command and may not be used within a BASIC program.

### Examples:

```
SAVE
SAVE #
SAVE/10B
SAVE "PROG1"
SAVE/10B, 100, 200
SAVE #5, "SUBR1" 400, 500
```

### NOTE:

Any attempt to modify a loaded protected program results in an error message being displayed (ERR 44).
Section VIII Tape Cassettes

**SKIP**

**CASSETTE STATEMENT**

**General Form:**

```
SKIP [ #n, ] (END)

[ /xxx, ] { n, nF }
```

where

- #n = File number to which a cassette device address has been assigned; n is an integer from 1 to 6.
- xxx = Device address of cassette
  If neither of the above is specified, the default device address (the device address currently assigned to TAPE (see SELECT)) is used.
- END = Skip to the end of current data file.
- n = Skip n logical data records.
- nF = Skip n files.
- n = expression (the integer portion of the value of the expression is used, must be ≥ 1)

**Purpose**

The SKIP statement allows the user to skip over any number of program or data files, or any number of data records. The END parameter is used with data files only. It causes the indicated cassette tape to skip to the end of the current data file; the tape is positioned before the trailer record. The n parameter is also used exclusively with data files. It causes the indicated cassette tape to skip n logical data records. If the trailer record is encountered, the tape backspaces so that it is positioned before the trailer record. The nF parameter causes the tape to skip n complete program or data files; the tape is positioned at the beginning of the next file.

**Example:**

```
350 SKIP END
270 SKIP #1, 2F
SKIP 10
SKIP/10B, (X+2)F
```
Section IX

Error Codes

THREE TYPES OF ERRORS CAN OCCUR . . . . . . . . . . 122
ERROR CODES . . . . . . . . . . . . . . . . . . . . . . . . 124
Section IX Error Codes

The Wang System 2200S BASIC checks for and displays syntax errors as each line is entered. The user may then correct the error before proceeding with his program. When any error is detected, the line being scanned by the system is displayed and on the next line, an "↑" symbol is placed at the point of the error followed by the error message number.

The following example shows the format of the System 2200S error pointer:

:10 DIM A(P)
↑ ERR 13

The user may then refer to the listing of error messages to identify the error by code number. The list contains a description of each and a suggested method for correcting the error.

NOTE:
An error message can only indicate one possible type of error.

Example:

:PXINT X
↑ ERR 06 (expected equal sign)

The system has interpreted ‘P’ as a variable and thus expects an equal sign following ‘P’; whereas, the user may have meant:

:PRINT X

The system assumes the statement is correct until illegal syntax is discovered.

The error message, SYSTEM ERROR!, is displayed if certain hardware failures occur. The user should RESET or MASTER INITIALIZE (Power On, Power Off) the system and re-enter the sequence of events that produced this error.

NOTE:
Certain combinations of illegal or meaningless operations may also result in a SYSTEM ERROR message.

THREE TYPES OF ERRORS CAN OCCUR

A Syntax Error

Results when the required format of a System 2200S BASIC statement is violated. Pressing a sequence of keys not recognized as an accepted combination results in this type of error. Syntax errors in a statement are recognized and noted, as soon as the execute key is touched to enter a statement. Examples of this type of error include mispelling verbs, illegal formats for numbers, operators, parentheses, and the improper use of punctuation.

Example:

:10 DEFFN . (X) = 3*X↑2 - 2*X↑3
↑ ERR 21
Section IX Error Codes

An Error of Execution
Results when an illegal arithmetic operation is performed, or the execution of an illegal statement or programming procedure is attempted when a program is executed. This type of error differs from a Syntax Error. The statement itself uses the proper syntax. However, the execution of the statement is impossible to perform and leads to an error condition. Typical errors of this type include illegal branches, arithmetic overflow or underflow, illegal "FOR" loops, etc.

Example:

(Branch to non-existant statement number)
:100 GOTO 110
:105 PRINT "VALUES = " ;A, B, C
:120 END
:RUN
100 GOTO 110
^ERR 11

A Programming Error
The 2200S executes the statements entered properly, but the results obtained are not correct, because the wrong information or logic is used in writing a program. Although there is no way for the 2200S to identify a programming error, debugging features such as TRACE, HALT/STEP, CONTINUE, can significantly speed up the process of debugging a program.
Section IX Error Codes

CODE 01
Error: Text Overflow
Cause: All available space for BASIC statements and system commands has been used.
Action: Shorten and/or chain program by using COM statements, and continue. The compiler automatically removes the current and highest-numbered statement.
Example:

:10 FOR I = 1 TO 10
:20 LET X = SIN(I)
:30 NEXT I
...
:820 IF Z = A-B THEN 900
†ERR 01
(the number of characters in the program exceeded the available space in memory for program text when line 820 was entered)
User must shorten or segment program.

CODE 02
Error: Table Overflow
Cause: The program and space required to store program variables and values exceeds the storage capacity of the system; the program is repetitively branching out of FOR/NEXT loops without completing them; or the program is calling subroutines but not returning. Error 2 results when approximately 20 levels of loops and/or subroutine nesting have occurred. Noncommon variables are removed automatically by the system when error 2 occurs.
Action: Correct any improper exit from FOR/NEXT loops or subroutines (the RETURN CLEAR statement can be used to exit from a subroutine without returning); shorten the program by eliminating unnecessary text and variables; or segment the program.
Example:

:10 DIM A(19), B(10, 10), C(10, 10)
:RUN
†ERR 02
(the table space required for variables exceeded the table limit for variable storage as line 10 was processed)
User must compress program and variable storage requirements.

CODE 03
Error: Math Error
Cause: 1. EXPONENT OVERFLOW. The resulting magnitude of the number calculated was greater than or equal to $10^{100}$. (+, -, *, /, ↑, TAN, EXP).
2. DIVISION BY ZERO.
3. NEGATIVE OR ZERO LOG FUNCTION ARGUMENT.
4. NEGATIVE SQR FUNCTION ARGUMENT.
5. INVALID EXPONENTIATION. An exponentiation, $(X↑Y)$ was attempted where $X$ was negative and $Y$ was not an integral, producing an imaginary result, or $X$ and $Y$ were both zero.
6. ILLEGAL SIN, COS, OR TAN ARGUMENT. The function argument exceeds $2\pi \times 10^{11}$ radians.
Action: Correct the program or program data.
Example:

PRINT (2E + 64) / (2E - 41)
†ERR 03 (exponent overflow)
Section IX Error Codes

CODE 04
Error: Missing Left Parenthesis
Cause: A left parenthesis ( ( ) was expected.
Action: Correct statement text.
Example: :
10 DEF FNA V) = SIN(3*V-1) 
\text{ERR 04}
10 DEF FNA(V) + SIN(3*V-1) \text{(Possible Correction)}

CODE 05
Error: Missing Right Parenthesis
Cause: A right ( ) parenthesis was expected.
Action: Correct statement text.
Example: :
10 Y = INT(1.2↑5) 
\text{ERR 05}
10 Y = INT(1.2↑5) \text{(Possible Correction)}

CODE 06
Error: Missing Equals Sign
Cause: An equals sign (=) was expected.
Action: Correct statement text.
Example: :
10 DEFFNC(V) = V + 2 
\text{ERR 06}
10 DEFFNC(V) = V+2 \text{(Possible Correction)}

CODE 07
Error: Missing Quotation Marks
Cause: Quotation marks were expected.
Action: Reenter the DATASAVE OPEN statement correctly.
Example: :
DATASAVE OPEN "TTTT" 
\text{ERR 07}
DATASAVE OPEN "TTTT" \text{(Possible Correction)}

CODE 08
Error: Undefined FN Function
Cause: An undefined FN function was referenced.
Action: Correct program to define or reference the function correctly.
Example: :
10 X=FNC(2)
20 PRINT "'X'';X
30 END
RUN
10 X=FNC(2) 
\text{ERR 08}
05 DEFFNC(V)=COS(2*V) \text{(Possible Correction)}
Section IX Error Codes

CODE 09
Error: Illegal FN Usage
Cause: More than five levels of nesting were encountered when evaluating an FN function.
Action: Reduce the number of nested functions.
Example:
```
:10 DEF FN1(X)=1+X
:20 DEF FN3(X)=1+FN2(X)
:30 DEF FN5(X)=1+FN4(X)
:40 PRINT FN6(2)
:RUN
10 DEF FN1(X)=1+X
:DEF FN2(X)=1+FN1(X)
↑ERR 09
:40 PRINT 1+FN5(2) (Possible Correction)
```

CODE 10
Error: Incomplete Statement
Cause: The end of the statement was expected.
Action: Complete the statement text.
Example:
```
:10 PRINT X”
↑ERR 10
:10 PRINT “X”
OR
:10 PRINT X (Possible Correction)
```

CODE 11
Error: Missing Line Number or Continue Illegal
Cause: The line number is missing or a referenced line number is undefined; or the user is attempting to continue program execution after one of the following conditions: A text or table overflow error, a new variable has been entered, a CLEAR command has been entered, the user program text has been modified, or the RESET key has been pressed.
Action: Correct statement text.
Example:
```
:10 GOSUB 200
↑ERR 11
:10 GOSUB 100 (Possible Correction)
```

CODE 12
Error: Missing Statement Text
Cause: The required statement text is missing (THEN, STEP, etc.).
Action: Correct statement text.
Example:
```
:10 IF I=12•X,45
↑ERR 12
:10 IF I=12•X THEN 45 (Possible Correction)
```
Section IX Error Codes

CODE 13
Error: Missing or Illegal Integer
Cause: A positive integer was expected or an integer was found which exceeded the allowed limit.
Action: Correct statement text.
Example:

```
:10 COM D(P)
↑ERR 13
:10 COM D(8)
```
(Possible Correction)

CODE 14
Error: Missing Relation Operator
Cause: A relational operator ( <, =, >, <=, >=, <> ) was expected.
Action: Correct statement text.
Example:

```
:10 IF A-B THEN 100
↑ERR 14
:10 IF A=B THEN 100
```
(Possible Correction)

CODE 15
Error: Missing Expression
Cause: A variable, or number, or a function was expected.
Action: Correct statement text.
Example:

```
:10 FOR I=, TO 2
↑ERR 15
:10 FOR I=1 TO 2
```
(Possible Correction)

CODE 16
Error: Missing Scalar
Cause: A scalar variable was expected.
Action: Correct statement text.
Example:

```
:10 FOR A(3)=1 TO 2
↑ERR 16
:10 FOR B=1 TO 2
```
(Possible Correction)

CODE 17
Error: Missing Array
Cause: An array variable was expected.
Action: Correct statement text.
Example:

```
:10 DIM A2
↑ERR 17
:10 DIM A(2)
```
(Possible Correction)
Section IX Error Codes

CODE 18
Error: Illegal Value
Cause: The value exceeds the allowable limit. For example, a dimension is greater than 255 or an array variable subscript exceeds the defined dimension.
Action: Correct the program.
Example:
:10 DIM A(2,3)
:20 A(1,4) = 1
:RUN
20 A(1,4) = 1
↑ERR 18
:10 DIM A(2,4) (Possible Correction)

CODE 19
Error: Missing Number
Cause: A number was expected.
Action: Correct statement text.
Example:
:10 DATA L
↑ERR 19
:10 DATA + (Possible Correction)

CODE 20
Error: Illegal Number Format
Cause: A number format is illegal.
Action: Correct statement text.
Example:
:10 A=12345678.234567 (More than 13 digits of mantissa)
↑ERR 20
:10 A=12345678.23456 (Possible Correction)

CODE 21
Error: Missing Letter or Digit
Cause: A letter or digit was expected.
Action: Correct statement text.
Example:
:10 DEF FN.(X)=X↑5-1
↑ERR 21
:10 DEF FN1(X)=X↑5-1 (Possible Correction)
Section IX Error Codes

CODE 22
Error: Undefined Array Variable
Cause: An array variable is referenced in the program which was not defined properly in a DIM or COM statement (i.e., an array variable was not defined in a DIM or COM statement) or an array variable has been referenced both as a 1-dimensional and as a 2-dimensional array.
Action: Correct statement text.
Example:
:10 A(2,2) = 123
:RUN
10 A(2,2) = 123
↑ERR 22
:1 DIM A(4,4) (Possible Correction)

CODE 23
Error: No Program Statements
Cause: A RUN command was entered but there are no program statements.
Action: Enter program statements.
Example:
:RUN
↑ERR 23

CODE 24
Error: Illegal Immediate Mode Statement
Cause: An illegal verb or transfer in an immediate execution statement was encountered.
Action: Re-enter a corrected immediate execution statement.
Example:
IF A = 1 THEN 100
↑ERR 24
Section IX Error Codes

CODE 25
Error: Illegal GOSUB/RETURN Usage
Cause: There is no companion GOSUB statement for a RETURN statement, or a branch was made into the middle of a subroutine.
Action: Correct the program.
Example:

```
10 FOR I=1 TO 20
20 X=I*SIN(I+4)
25 GO TO 100
30 NEXT I: END
100 PRINT "X=";X
110 RETURN
RUN
X=-.7568025
110 RETURN
↑ ERR 25
```

(Possible Correction)

```
25 GOSUB 100
```

CODE 26
Error: Illegal FOR/NEXT Usage
Cause: There is no companion FOR statement for a NEXT statement, or a branch was made into the middle of a FOR loop.
Action: Correct the program.
Example:

```
10 PRINT "I=";I
20 NEXT I
30 END
RUN
I = 0
20 NEXT I
↑ ERR 26
```

(Possible Correction)

```
5 FOR I=1 TO 10
```

CODE 27
Error: Insufficient Data
Cause: There is insufficient data for READ statement requirements.
Action: Correct program to supply additional data.
Example:

```
10 DATA 2
20 READ X,Y
30 END
RUN
20 READ X,Y
↑ ERR 27
```

(Possible Correction)

```
11 DATA 3
```
Section IX Error Codes

CODE 28
Error: Data Reference Beyond Limits
Cause: The data reference in a RESTORE statement is beyond the existing data limits.
Action: Correct the RESTORE statement.
Example:
:10 DATA 1,2,3
:20 READ X,Y,Z
:30 RESTORE 5
....
....
....
:90 END
:RUN
:30 RESTORE 5
↑ERR 28
:30 RESTORE 2 (Possible Correction)

CODE 29
Error: Illegal Data Format
Cause: The data format for an INPUT statement is illegal (format error).
Action: Reenter data in the correct format starting with erroneous number or terminate run with the RESET key and run again.
Example:
:10 INPUT X,Y
....
....
....
:90 END
:RUN
:INPUT
?1A,2E-30
↑ERR 29
?12,2E-30 (Possible Correction)

CODE 30
Error: Illegal Common Assignment
Cause: A COM statement variable definition was preceded by a non-common variable definition.
Action: Correct program, making all COM statements the first numbered lines.
Example:
:10 A=1 :B=2
:20 COM A,B
:99 END
:RUN

20 COM A,B
↑ERR 30
:10[CR/LF=EXECUTE] (Possible Correction)
:30 A=1 :B=2
Section IX Error Codes

CODE 31
Error: Illegal Line Number
Cause: The 'statement number' key was pressed producing a line number greater than 9999; or in renumbering a program with the RENUMBER command a line number was generated which was greater than 9999.
Action: Correct the program.
Example:
:9995 PRINT X,Y
:[line number key]
↑ERR 31

CODE 33
Error: Missing HEX Digit
Cause: A digit or a letter from A-F was expected.
Action: Correct the program text.
Example:
:10 SELECT PRINT 00P
↑ERR 33
:10 SELECT PRINT 005 (Possible Correction)

CODE 34
Error: Tape Read Error
Cause: The system was unable to read the next record on the tape; the tape is positioned after the bad record.

CODE 35
Error: Missing Comma or Semicolon
Cause: A comma or semicolon was expected.
Action: Correct statement text.
Example:
:10 DATASAVE #2 X,Y,Z
↑ERR 35
:10 DATASAVE #2,X,Y,Z (Possible Correction)

CODE 36
Error: Illegal Image Statement
Cause: No format (e.g. #.#) in image statement.
Action: Correct the statement text.
Example:
:10 PRINTUSING 20, 1.23
:20% AMOUNT =
:RUN
:10 PRINTUSING 20,1.23
↑ERR 36
:20% AMOUNT = ###### (Possible Correction)
Section IX Error Codes

CODE 37
Error: Statement Not Image Statement
Cause: The statement referenced by the PRINTUSING statement is not an image statement.
Action: Correct the statement text.
Example: 
:10 PRINTUSING 20,X
:20 PRINT X
:RUN
:10 PRINTUSING 20,X
↑ERR37
:20% AMOUNT = $#,###.## (Possible Correction)

CODE 38
Error: Illegal Floating Point Format
Cause: Fewer than 4 up arrows were specified in the floating point format in an image statement.
Action: Correct the statement text.
Example: 
:10 %###.####↑↑↑
↑ ERR 38
:10 %##.####↑↑↑

CODE 39
Error: Missing Literal String
Cause: A literal string was expected.
Action: Correct the text.
Example: 
:10 READ A$
:20 DATA 123
:RUN
20 DATA 123
↑ERR 39
20 DATA "123" (Possible Correction)

CODE 40
Error: Missing Alphanumeric Variable
Cause: An alphanumeric variable was expected.
Action: Correct the statement text.
Example: 
:10 A$, X = "JOHN"
↑ERR 40
:10 A$, X$ = "JOHN"

CODE 41
Error: Illegal STR() Arguments
Cause: The STR() function arguments exceed the maximum length of the string variable.
Example: 
:10 B$ = STR(A$, 10, 8)
↑ERR 41
:10 B$ = STR(A$, 10, 6) (Possible Correction)
Section IX Error Codes

**CODE 42**
Error: File Name Too Long
Cause: The program name specified is too long (a maximum of 8 characters is allowed).
Action: Correct the program text.
Example: 
:SAVE "PROGRAM#1"
↑ERR 42
:SAVE "PROGRAM1" (Possible Correction)

**CODE 43**
Error: Wrong Variable Type
Cause: During a DATALOAD operation a numeric (or alphanumeric) value was expected but an alphanumeric (or numeric) value was read.
Action: Correct the program or make sure proper tape is mounted.
Example: 
:DATALOAD X, Y
↑ERR 43
:DATALOAD X$, Y$ (Possible Correction)

**CODE 44**
Error: Program Protected
Cause: A program loaded was protected and, hence, cannot be SAVED or LISTED.
Action: Execute a CLEAR command to remove protect mode, (but, program will be scratched).

**CODE 45**
Error: Statement Line Too Long
Cause: A statement line may not exceed 192 keystrokes.
Action: Shorten the statement line being entered.

**CODE 46**
Error: New Starting Statement Number Too Low
Cause: The new starting statement number in a RENUMBER command is not greater than the next lowest statement number.
Action: Reenter the RENUMBER command correctly.
Example: 
50 REM – PROGRAM 1
62 PRINT X, Y
73 GOSUB 590
:
:RENUMBER 62, 20, 5
↑ERR 46
:RENUMBER 62, 60, 5 (Possible Correction)

**CODE 47**
Error: Illegal Or Undefined Device Specification
Cause: The #n device specifications in a program statement is undefined.
Action: Define the specified device numbers.
Example: 
:SAVE #2
↑ERR 47
:SELECT #2 10A
:SAVE #2 (Possible Correction)
Section IX Error Codes

CODE 48
Error: Undefined Keyboard Function
Cause: There is no mark (DEFFN') in a user's program corresponding to the keyboard function key depressed.
Action: Correct the program.
Example: [:[keyboard function key #2]
\[ERR 48

CODE 49
Error: End of Tape
Cause: The end of tape was encountered during a tape operation.
Action: Correct the program or make sure the tape is correctly positioned.
Example: 100 DATALOAD X, Y, Z
\[ERR 49

CODE 50
Error: Protected Tape
Cause: A tape operation is attempting to write on a tape cassette that has been protected (by tab on bottom of cassette tape).
Action: Mount another cassette or "unprotect" the tape cassette by covering the punched hole on the bottom of the cassette with the tab.
Example: SAVE /103
\[ERR 50

CODE 51
Error: Illegal Statement
Cause: The System 2200S does not have the capability to process this BASIC statement.
Action: Do not use this statement.

CODE 52
Error: Expected Data (Nonheader) Record
Cause: A DATALOAD operation was attempted but the device was not positioned at a data record.
Action: Make sure the correct device is positioned correctly.

CODE 53
Error: Illegal Use of HEX Function
Cause: The HEX() function is being used in an illegal situation. The HEX function may not be used in a PRINTUSING statement.
Action: Do not use HEX function in this situation.
Example: :10 PRINTUSING 200, HEX(F4F5)
\[ERR 53
:10 A$ = HEX(F4F5)
:20 PRINTUSING 200,A$ (Possible Correction)
Section IX Error Codes

CODE 54
Error: Illegal Plot Argument
Cause: An argument in the PLOT statement is illegal.
Action: Correct the PLOT statement.
Example: 100 PLOT < 5, , H >
          ↑ ERR 54
          100 PLOT < 5, , C >    (Possible Correction)

CODE 55
Error: Illegal BT Argument
Cause: An argument in a DATALOAD BT or DATASAVE BT statement is illegal.
Action: Correct the statement in error.
Example: 100 DATALOAD BT (M=50) A$
          ↑ ERR 55
          100 DATALOAD BT (N=50) A$    (Possible Correction)

CODE 56
Error: Number Exceeds Image Format
Cause: The value of the number being packed or converted is greater than the number integer
digits provided for in the pack or convert image.
Action: Change the image specification.
Example: 100 PACK (##) A$ FROM 1234
          ↑ ERR 56
          100 PACK (#####) A$ FROM 1234    (Possible Correction)

CODE 57
Error: Illegal Disk Sector Address
Cause: Illegal disk sector address specified, value is negative or greater than 32767. (The
System 2200S cannot store a sector address greater than 32767.)
Action: Correct the program statement in error.
Example: 100 DATASAVE DAF (42000,X) A,B,C.
          ↑ ERR 57
          100 DATASAVE DAF (4200,X) A,B,C    (Possible Correction)
Section IX Error Codes

CODE 58
Error: Expected Data Record
Cause: A program record or header record was read when a data record was expected.
Action: Correct the program.
Example: 100 DATALOAD DAF(0,X) A,B,C
         ↑ERR 58

CODE 59
Error: Illegal Alpha Variable For Sector Address
Cause: Alphanumeric receiver for the next available address in the disk DA instruction is not at least 2 bytes long.
Action: Dimension the alpha variable to be at least two characters long.
Example: 10   DIM A$1
         100 DATASAVE DAR( ) ,A$ ) X,Y,Z
         ↑ERR 59
         10   DIM A$2
         (Possible Correction)

CODE 60
Error: Array Too Small
Cause: The alphanumeric array does not contain enough space to store the block of information being read from disk or tape or being packed into it. For cassette tape and disk records, the array must contain at least 256 bytes (100 bytes for 100 byte cassette blocks).
Action: Increase the size of the array.
Example: 10   DIM A$(15)
         20   DATALOAD BT A$( )
         ↑ERR 60
         10   DIM A$(16)
         (Possible Correction)

CODE 61
Error: Disk Hardware Error
Cause: The disk did not recognize or properly respond back to the System 2200S during read or write operation in the proper amount of time.
Action: Run program again. If error persists, re-initialize the disk; contact Wang service personnel.
Example: 100 DATASAVE DCF X,Y,Z
         ↑ERR 61
Section IX Error Codes

CODE 62
Error: File Full
Cause: The disk sector being addressed is not located within the catalogued specified file. When writing the file is full, for other operations, a SKIP or BACKSPACE has set the sector address beyond the limits of the file.
Action: Correct the program.
Example: 100 DATASAVE DCT#2, A$( ), B$( ), C$( )
         †ERR 62

CODE 63
Error: Missing Alpha Array Designator
Cause: An alpha array designator (e.g., A$( ) ) was expected. (Block operations for cassette and disk require an alpha array argument.)
Action: Correct the statement in error.
Example: 100 DATALOAD BT A$
         †ERR 63
         100 DATALOAD BT A$( )  (Possible Correction)

CODE 64
Error: Sector Not On Disk
Cause: The disk sector being addressed is not on the disk. (Maximum legal sector address depends upon the model of disk used.)
Action: Correct the program statement in error.
Example: 100 MOVEEND F = 10000
         †ERR 64
         100 MOVEEND F = 9791  (Possible Correction)

CODE 65
Error: Disk Hardware Malfunction
Cause: A disk hardware error occurred (i.e., the disk is not in file ready position. This could occur, for example, if the disk is in LOAD mode or power is not turned on).
Action: Insure disk is turned on and properly setup for operation. Set the disk into LOAD mode and then back into RUN mode, with the RUN/LOAD selection switch. The check light should then go out. If error persists call your Wang Service personnel. (Note, the disk should never be left in LOAD mode when running.)
Example: 100 DATALOAD DCF A$,B$
         †ERR 65
Section IX Error Codes

CODE 66
Error: Format Key Engaged
Cause: The disk format key is engaged. (The key is normally engaged only when formatting a disk pack.)
Action: Turn off the format key.
Example: 100 DATASAVE DCF X,Y,Z
↑ERR 66

CODE 67
Error: Disk Format Error
Cause: A disk format error was detected on disk read or write. The disk is not properly formatted such that sector addresses can be read.
Action: Format the disk again.
Example: 100 DATALOAD DCF X,Y,Z
↑ERR 67

CODE 68
Error: LRC Error
Cause: A disk longitudinal redundancy check error occurred when reading a sector. The data may have been written incorrectly, or the System 2200S/Disk Controller could be malfunctioning.
Action: Run program again. If error persists, re-write the bad sector. If error still persists, call Wang Service personnel.
Example: 100 DATALOAD DCF A$( )
↑ERR 68

CODE 71
Error: Cannot Find Sector
Cause: A disk seek error occurred; the specified sector could not be found on the disk.
Action: Run program again. If error persists, re-initialize (reformat) the disk pack. If error still occurs call Wang Service personnel.
Example: 100 DATALOAD DCF A$( )
↑ERR 71
Section IX Error Codes

**CODE 72**

Error: Cyclic Read Error
Cause: A cyclic redundancy check disk read error occurred; the sector being addressed has never been written to or subsequently the sector was incorrectly written on disk (i.e., the disk pack was never initially formatted).
Action: Format the disk if it was not done. If the disk was formatted, re-write the bad sector, or reformat the disk. If error persists call Wang Service personnel.
Example: 100 MOVEEND F = 8000
        ↑ERR 72

**CODE 73**

Error: Illegal Altering Of A File
Cause: The user is attempting to rename or write over an existing scratched file, but is not using the proper syntax. The scratched file name must be referenced.
Action: Use the proper form of the statement.
Example: SAVE DCF "SAM1"
        ↑ERR 73
        SAVE SCF ("SAM1") "SAM1"         (Possible Correction)

**CODE 74**

Error: Catalog End Error
Cause: The end of catalog area falls within the library index area or has been changed by MOVEEND to fall within the area already used by the catalog; or there is no room left in the catalog area to store more information.
Example: SCRATCH DISK F LS=100, END=50
        ↑ERR 74
        SCRATCH DISK F LS=100, END=500         (Possible Correction)

**CODE 75**

Error: Command Only (Not Programmable)
Cause: A command is being used within a BASIC program; Commands are not programmable.
Action: Do not use commands as program statements.
Example: 10 LIST
        ↑ERR 75
Section IX Error Codes

CODE 76
Error: Missing < or > (Plot Enclosures)
Cause: The required PLOT enclosures are not in the PLOT statement.
Action: Correct the statement in error.
Example:
```
100 PLOT A, B, "*"
     ↑ERR 76
100 PLOT <A, B, "*"> (Possible Correction)
```

CODE 77
Error: Starting Sector Greater Than Ending Sector
Cause: The starting sector address specified is greater than the ending sector address specified.
Action: Correct the statement in error.
Example:
```
10 COPY FR(1000, 100)
     ↑ERR 77
10 COPY FR(100, 1000) (Possible Correction)
```

CODE 78
Error: File Not Scratched
Cause: A file is being renamed that has not been scratched.
Action: Scratch the file before renaming it.
Example:
```
SAVE DCF (LINREG") "LINREG2"
     ↑ERR 78
SCRATCH F "LINREG"
SAVE DCF ("LINREG") "LINREG2" (Possible Correction)
```

CODE 79
Error: File Already Catalogued
Cause: An attempt was made to catalogue a file with a name that already exists in the catalogue index.
Action: Use a different name.
Example:
```
SAVE DCF "MATLIB"
     ↑ERR 79
SAVE DCF "MATLIB1" (Possible Correction)
```
Section IX Error Codes

CODE 80
Error: File Not In Catalog
Cause: The error may occur if one attempts to address a non-existing file name or to load a data file as a program or open a program file as a data file.
Action: Make sure you’re using the correct file name; make sure the proper disk pack is mounted.
Example:

```
LOAD DCR "PRES"
  ERR 80
LOAD DCF "PRES"  (Possible Correction)
```

CODE 81
Error: /XXX DeviceSpecification Illegal
Cause: The /XXX device specification may not be used in this statement.
Action: Correct the statement in error.
Example:

```
100 DATASAVE DC /310, X
  ERR 81
100 DATASAVE DC #1, X  (Possible Correction)
```

CODE 82
Error: No End Of File
Cause: No end of file record was recorded on file and therefore could not be found in a SKIP END operation.
Action: Correct the file.
Example:

```
100D SKIP END
  ERR 82
```

CODE 83
Error: Disk Hardware Failure
Cause: A disk address cannot be properly transferred from the System 2200S to the disk when processing MOVE or COPY.
Action: Run program again. If error persists, call Wang Field Service Personnel.
Example:

```
COPY FR(100,500)
  ERR 83
```
Section IX Error Codes

CODE 84
Error: Not Enough System 2200S Memory Available For MOVE or COPY
Cause: A 1K buffer is required in memory for MOVE or COPY operation. (i.e., 1000 bytes should be available and not occupied by program and variables).
Action: Clear out all or part of program or program variables before MOVE or COPY.
Example: COPY FR(0, 9000)
†ERR 84

CODE 85
Error: Read After Write Error
Cause: The comparison of read after write to a disk sector failed. The information was not written properly.
Action: Write the information again. If error persists, call Wang Field Service personnel.
Example: 100 DATASAVE DCF$ X, Y, Z
†ERR 85

CODE 86
Error: File Not Open
Cause: The file was not opened.
Action: Open the file before reading from it.
Example: 100 DATALOAD DC A$
†ERR 86
10 DATALOAD DC OPEN F "DATFIL" (Possible Correction)

CODE 87
Error: Common Variable Required
Cause: The variable in the LOAD DA statement, used to receive the sector address of the next available sector after the load, is not a common variable.
Action: Define the variable to be common.
Example: 10 LOAD DAR (100, L)
†ERR 87
5 COM L (Possible Correction)

CODE 88
Error: Library Index Full
Cause: There is no more room in the index for a new name.
Action: Scratch any unwanted files and compress the catalog using a MOVE statement or mount a new disk platter.
Example: SAVE DCF "PRGM"
†ERR 88
Section IX Error Codes

CODE 89
Error: Matrix Not Square
Cause: The dimensions of the operand in a MAT inversion or identity are not equal.
Action: Correct the array dimensions.
Example:
:10 MAT A=IDN(3,4)
:RUN
10 MAT A=IDN(3,4)
↑ERR 89
:10 MAT A=IDN(3,3) (Possible Correction)

CODE 90
Error: Matrix Operands Not Compatible
Cause: The dimensions of the operands in a MAT statement are not compatible; the operation cannot be performed.
Action: Correct the dimensions of the arrays.
Example:
:10 MAT A=CON(2,6)
:20 MAT B=IDN(2,2)
:30 MAT C=A+B
:RUN
30 MAT C=A+B
↑ERR 90
:10 MAT A=CON(2,2) (Possible Correction)

CODE 91
Error: Illegal Matrix Operand
Cause: The same array name appears on both sides of the equal sign in a MAT multiplication or transposition statement.
Action: Correct the statement.
Example:
:10 MAT A=A*B
↑ERR 91
:10 MAT C=A*B (Possible Correction)
Section IX Error Codes

CODE 92
Error: Illegal Redimensioning Of Array
Cause: The space required to redimension the array is greater than the space initially reserved for the array.
Action: Reserve more space for array in DIM or CON statement.
Example:
:10 DIM(3,4)
:20 MAT A=CON(5,6)
:RUN
  20 MAT A=CON(5,6)
  ↑ERR 92
:10 DIM A(5,6) (Possible Correction)

CODE 93
Error: Singular Matrix
Cause: The operand in a MAT inversion statement is singular and cannot be inverted.
Action: Correct the program.
Example:
:10 MAT A=ZER(3,3)
:20 MAT B=INV(A)
:RUN
  20 MAT B=INV(A)
  ↑ERR 93

CODE 94
Error: Missing Asterisk
Cause: An asterisk (*) was expected.
Action: Correct statement text.
Example:
:10 MAT C=(3)B
  ↑ERR 94
:10 MAT C=(3)*B (Possible Correction)
Section X

SPECIFICATIONS

CRT (Cathode Ray Tube) — Model 2216

Unit Size
- Height: 14 in. (35.6 cm)
- Depth: 16 in. (40.6 cm)
- Width: 21½ in. (54.6 cm)

Display Size
- Height: 8 in. (20.3 cm)
- Width: 10½ in. (26.7 cm)

Capacity
- 16 lines, 64 characters/line

Character Size
- Height: 0.20 in. (0.51 cm)
- Width: 0.12 in. (0.30 cm)

Weight
- 36 lb (16.3 kg)

Integrated CRT, Single Tape Cassette Drive,
Keyboard — Model 2220

Unit Size
- Height: 13½ in. (34.2 cm)
- Depth: 20½ in. (52 cm)
- Width: 19½ in. (50.2 cm)

Weight
- 48 lb (21.7 kg)

Display Size
- Diagonal: 9 in. (22.8 cm)

Capacity
- 16 lines, 64 characters/line

Character Size
- Height: 0.125 in. (0.32 cm)
- Width: 0.125 in. (0.32 cm)

System 2200S Power Requirements
- 115 VAC or 230 VAC ± 10%
- 50 or 60 Hz ± ½ cycle

System 2200S Operating Environment
- 50°F to 90°F (10°C to 32°C)
- 20% to 90% relative humidity

CASSETTE—Model 2217, and Integrated
MODEL 2220

Stop/Start Time
- 0.09/0.05 sec

Capacity
- 522 bytes/ft (1712 bytes/m)

Recording Speed
- 7.5 IPS (19.05 cm/sec)

Search Speed
- 7.5 IPS (19.05 cm/sec)

Transfer Rate
326 characters/sec (approx.)

Inter-record Gap
0.6 in. (1.52 cm)
(Capacity and transfer rate include gaps and redundant recording.)

CPU (Central Processing Unit) — System 2200S

Built-in Functions
Mathematical & Trigonometric Functions*
- EXP: e to the power of x
- LOG: Natural Log
- SQR: Square Root
- π: Pi
- SIN: Sine
- COS: Cosine
- TAN: Tangent
- ARCSIN: Inverse Sine
- ARCCOS: Inverse Cosine
- ARCTAN: Inverse Tangent
- RND: Random Number Generator

Logical & Data Manipulation Functions
- ABS: Absolute Value of a Number
- INT: Integer Value of a Number
- 1, 0, or +1 if a number is negative, 0, or positive.

STR: Selection of one or more characters in an alphanumeric string.
- HEX: Hexadecimal Values
- LEN: Length of Alphanumeric Variable

CPU (Central Processing Unit) — System 2200S
(Continued)

Variable Formats
Scalar Numeric Variable.
Numeric 1- and 2-dimension Array Variables.
Alphanumeric String Variable.
Alphanumeric 1- and 2-dimensional String Arrays.

Average Execution Times (Milliseconds)
Add/Subtract 0.8
Multiply/Divide 3.87/7.4
Square Root/e^x 46.4/25.3
Log_e x/X^y 23.2/45.4
Integer/Absolute Value 0.24/0.02
Sign/Sine 0.25/38.3
Cosine/Tangent 38.9/78.5

The Wang PROGRAMMER is the official publication of Wang Laboratories Users Society, SWAP. The PROGRAMMER has been issued monthly at Tewksbury, Massachusetts since July 1967 and is now published quarterly and mailed to all SWAP members. Its prime objective is to provide useful information to users of Wang equipment and computing systems throughout the world. Readers who have programs, applications or articles which may be shared with other users are invited to submit them to the Editor. Readers interested in joining the Society for Wang Applications and Programs should write to SWAP, c/o Wang Laboratories, 836 North Street, Tewksbury, Massachusetts 01876.
